

# ***Solution***      **Section 1.5 – Transpose, Diagonal, Triangular, and Symmetric Matrices**

## ***Exercise***

Solve  $Lc = b$  to find  $c$ . Then solve  $Ux = c$  to find  $x$ . What was  $A$ ?

$$L = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix} \quad U = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \quad b = \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix}$$

## **Solution**

$$Lc = b$$

$$\begin{pmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} c_1 \\ c_2 \\ c_3 \end{pmatrix} = \begin{pmatrix} 4 \\ 5 \\ 6 \end{pmatrix}$$

$$\rightarrow \begin{cases} \boxed{c_1 = 4} \\ c_1 + c_2 = 5 \Rightarrow \boxed{c_2 = 5 - 4 = 1} \\ c_1 + c_2 + c_3 = 6 \Rightarrow \boxed{c_3 = 6 - 4 - 1 = 1} \end{cases} \quad c = \begin{pmatrix} 4 \\ 1 \\ 1 \end{pmatrix}$$

$$Ux = c$$

$$\begin{pmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 4 \\ 1 \\ 1 \end{pmatrix}$$

$$\Rightarrow \begin{cases} x + y + z = 4 \\ y + z = 1 \\ \quad z = 1 \end{cases} \rightarrow \begin{cases} x = 3 \\ y = 0 \\ \quad z = 1 \end{cases} \quad x = \begin{pmatrix} 3 \\ 0 \\ 1 \end{pmatrix}$$

$$Lc = b \Rightarrow LUx = b$$

$$\underbrace{\begin{pmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 1 & 1 \end{pmatrix}}_A \underbrace{\begin{pmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix}}_U \underbrace{\begin{pmatrix} 3 \\ 0 \\ 1 \end{pmatrix}}_x = \underbrace{\begin{pmatrix} 4 \\ 5 \\ 6 \end{pmatrix}}_b$$

### Exercise

Find  $L$  and  $U$  for the symmetric matrix

$$A = \begin{bmatrix} a & a & a & a \\ a & b & b & b \\ a & b & c & c \\ a & b & c & d \end{bmatrix}$$

Find four conditions on  $a, b, c, d$  to get  $A = LU$  with four pivots

### Solution

$$\begin{aligned} A &= \begin{bmatrix} a & a & a & a \\ a & b & b & b \\ a & b & c & c \\ a & b & c & d \end{bmatrix} \\ &= \begin{bmatrix} 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 \\ 1 & 1 & 1 & 0 \\ 1 & 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} a & a & a & a \\ 0 & b-a & b-a & b-a \\ 0 & 0 & c-b & c-b \\ 0 & 0 & 0 & d-c \end{bmatrix} \end{aligned}$$

### Exercise

Determine whether the given matrix is invertible

$$\begin{bmatrix} -1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & \frac{1}{3} \end{bmatrix}$$

### Solution

The matrix is a diagonal matrix with nonzero entries on the diagonal, so it is invertible.

$$\begin{pmatrix} -1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & \frac{1}{3} \end{pmatrix}^{-1} = \begin{bmatrix} -1 & 0 & 0 \\ 0 & \frac{1}{2} & 0 \\ 0 & 0 & 3 \end{bmatrix}$$

### Exercise

Find  $A^2$ ,  $A^{-2}$ , and  $A^{-k}$  by inspection  $A = \begin{bmatrix} 1 & 0 \\ 0 & -2 \end{bmatrix}$

### Solution

$$A^2 = \begin{bmatrix} 1^2 & 0 \\ 0 & (-2)^2 \end{bmatrix} \\ = \begin{bmatrix} 1 & 0 \\ 0 & 4 \end{bmatrix}$$

$$A^{-2} = \begin{bmatrix} 1^{-2} & 0 \\ 0 & (-2)^{-2} \end{bmatrix} \\ = \begin{bmatrix} 1 & 0 \\ 0 & \frac{1}{4} \end{bmatrix}$$

$$A^{-k} = \begin{bmatrix} 1^{-k} & 0 \\ 0 & (-2)^{-k} \end{bmatrix} \\ = \begin{bmatrix} 1 & 0 \\ 0 & \frac{1}{(-2)^k} \end{bmatrix}$$

### ***Exercise***

Find  $A^2$ ,  $A^{-2}$ , and  $A^{-k}$  by inspection  $A = \begin{bmatrix} \frac{1}{2} & 0 & 0 \\ 0 & \frac{1}{3} & 0 \\ 0 & 0 & \frac{1}{4} \end{bmatrix}$

### **Solution**

$$A^2 = \begin{bmatrix} \left(\frac{1}{2}\right)^2 & 0 & 0 \\ 0 & \left(\frac{1}{3}\right)^2 & 0 \\ 0 & 0 & \left(\frac{1}{4}\right)^2 \end{bmatrix} \\ = \begin{bmatrix} \frac{1}{4} & 0 & 0 \\ 0 & \frac{1}{9} & 0 \\ 0 & 0 & \frac{1}{16} \end{bmatrix}$$

$$A^{-2} = \begin{bmatrix} \left(\frac{1}{2}\right)^{-2} & 0 & 0 \\ 0 & \left(\frac{1}{3}\right)^{-2} & 0 \\ 0 & 0 & \left(\frac{1}{4}\right)^{-2} \end{bmatrix}$$

$$= \begin{bmatrix} 4 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 16 \end{bmatrix}$$

$$A^{-k} = \begin{bmatrix} \left(\frac{1}{2}\right)^{-k} & 0 & 0 \\ 0 & \left(\frac{1}{3}\right)^{-k} & 0 \\ 0 & 0 & \left(\frac{1}{4}\right)^{-k} \end{bmatrix}$$

$$= \begin{bmatrix} 2^k & 0 & 0 \\ 0 & 3^k & 0 \\ 0 & 0 & 4^k \end{bmatrix}$$

### ***Exercise***

Find  $A^2$ ,  $A^{-2}$ , and  $A^{-k}$  by inspection  $A = \begin{bmatrix} -2 & 0 & 0 & 0 \\ 0 & -4 & 0 & 0 \\ 0 & 0 & -3 & 0 \\ 0 & 0 & 0 & 2 \end{bmatrix}$

### **Solution**

$$A^2 = \begin{bmatrix} 4 & 0 & 0 & 0 \\ 0 & 16 & 0 & 0 \\ 0 & 0 & 9 & 0 \\ 0 & 0 & 0 & 4 \end{bmatrix}$$

$$A^{-2} = \begin{bmatrix} \frac{1}{4} & 0 & 0 & 0 \\ 0 & \frac{1}{16} & 0 & 0 \\ 0 & 0 & \frac{1}{9} & 0 \\ 0 & 0 & 0 & \frac{1}{4} \end{bmatrix}$$

$$A^{-k} = \begin{bmatrix} (-2)^{-k} & 0 & 0 & 0 \\ 0 & (-4)^{-k} & 0 & 0 \\ 0 & 0 & (-3)^{-k} & 0 \\ 0 & 0 & 0 & (2)^{-k} \end{bmatrix}$$

### Exercise

Decide whether the given matrix is symmetric  $\begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix}$

### Solution

Not *symmetric*, since  $a_{12} \neq a_{21}$  ( $1 \neq -1$ )

### Exercise

Decide whether the given matrix is symmetric  $\begin{bmatrix} 2 & -1 & 3 \\ -1 & 5 & 1 \\ 3 & 1 & 7 \end{bmatrix}$

### Solution

*Symmetric*

### Exercise

Decide whether the given matrix is symmetric  $\begin{bmatrix} 0 & 0 & 1 \\ 0 & 2 & 0 \\ 3 & 0 & 0 \end{bmatrix}$

### Solution

Not *symmetric*, since  $a_{13} = 1 \neq 3 = a_{31}$

### Exercise

Find all values of the unknown constant(s) in order for  $A$  to be symmetric

$$A = \begin{bmatrix} 2 & a - 2b + 2c & 2a + b + c \\ 3 & 5 & a + c \\ 0 & -2 & 7 \end{bmatrix}$$

### Solution

$$\begin{cases} a - 2b + 2c = 3 \\ 2a + b + c = 0 \\ a + c = -2 \end{cases} \rightarrow a = 11, \quad b = 9, \quad c = -13$$

### ***Exercise***

Find a diagonal matrix  $A$  that satisfies the given condition  $A^{-2} = \begin{bmatrix} 9 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

### ***Solution***

$$\begin{aligned} \begin{pmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{pmatrix}^{-2} &= \begin{pmatrix} a^{-2} & 0 & 0 \\ 0 & b^{-2} & 0 \\ 0 & 0 & c^{-2} \end{pmatrix} \\ &= \begin{bmatrix} 9 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 1 \end{bmatrix} \end{aligned}$$

$$\rightarrow \begin{cases} a^{-2} = 9 \Rightarrow a = \pm 9^{-1/2} = \pm \frac{1}{3} \\ b^{-2} = 4 \Rightarrow b = \pm 2^{-1/2} = \pm \frac{1}{2} \\ c^{-2} = 1 \Rightarrow c = \pm 1^{-1/2} = \pm 1 \end{cases}$$

$$A = \begin{pmatrix} -\frac{1}{3} & 0 & 0 \\ 0 & \frac{1}{2} & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad A = \begin{pmatrix} -\frac{1}{3} & 0 & 0 \\ 0 & -\frac{1}{2} & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad A = \begin{pmatrix} -\frac{1}{3} & 0 & 0 \\ 0 & -\frac{1}{2} & 0 \\ 0 & 0 & -1 \end{pmatrix} \quad \dots$$

$$A = \begin{pmatrix} \pm \frac{1}{3} & 0 & 0 \\ 0 & \pm \frac{1}{2} & 0 \\ 0 & 0 & \pm 1 \end{pmatrix}$$

### Exercise

Let  $A$  be an  $n \times n$  symmetric matrix

- a) Show that  $A^2$  is symmetric
- b) Show that  $2A^2 - 3A + I$  is symmetric

### Solution

- a) The property of the transpose states that  $(AB)^T = B^T A^T$

$$\begin{aligned}\left(A^2\right)^T &= (AA)^T \\ &= A^T A^T \\ &= \left(A^T\right)^2 \quad \text{A is symmetric} \\ &= A^2\end{aligned}$$

$\therefore A^2$  is symmetric

$$\begin{aligned}\text{b) } \left(2A^2 - 3A + I\right)^T &= 2\left(A^2\right)^T - 3(A)^T + (I)^T \\ &= 2\left(A^T\right)^2 - 3A^T + (I)^T \quad \text{A and I are symmetric} \\ &= 2A^2 - 3A + I \\ \therefore 2A^2 - 3A + I &\text{ is Symmetric}\end{aligned}$$

### Exercise

Prove if  $A^T A = A$ , then  $A$  is symmetric and  $A = A^2$

### Solution

If  $A^T A = A$ , then

$$\begin{aligned}A^T &= \left(\begin{matrix} \textcolor{red}{A}^T & \textcolor{blue}{A} \end{matrix}\right)^T \\ &= \textcolor{blue}{A}^T \left(\begin{matrix} \textcolor{red}{A}^T \end{matrix}\right)^T \\ &= A^T A \\ &= \textcolor{blue}{A} \end{aligned}$$

So  $A$  is symmetric.

Since  $A = A^T$

$$\begin{aligned}A\textcolor{red}{A} &= A^T \textcolor{red}{A} & A^T A &= A \\ \textcolor{blue}{A}^2 &= \textcolor{blue}{A} \end{aligned}$$

### Exercise

A square matrix  $A$  is called **skew-symmetric** if  $A^T = -A$ . Prove

- a) If  $A$  is an invertible skew-symmetric matrix, then  $A^{-1}$  is skew-symmetric.
- b) If  $A$  and  $B$  are skew-symmetric matrices, then so are  $A^T$ ,  $A + B$ ,  $A - B$ , and  $kA$  for any scalar  $k$ .
- c) Every square matrix  $A$  can be expressed as the sum of a symmetric matrix and a skew-symmetric matrix.

$$\left[ \text{Hint: Note the identity } A = \frac{1}{2}(A + A^T) + \frac{1}{2}(A - A^T) \right]$$

### Solution

$$\begin{aligned} \text{a) } (A^{-1})^T &= (A^T)^{-1} \\ &= (-A)^{-1} \quad \text{skew-symmetric} \\ &= -A^{-1} \end{aligned}$$

$\therefore A^{-1}$  is also skew-symmetric

- b) Let  $A$  and  $B$  are skew-symmetric matrices

$$\begin{aligned} (A^T)^T &= (-A)^T \\ &= -A^T \end{aligned}$$

$$\begin{aligned} (A + B)^T &= A^T + B^T \\ &= -A - B \\ &= -(A + B) \end{aligned}$$

$$\begin{aligned} (A - B)^T &= A^T - B^T \\ &= -A + B \\ &= -(A - B) \end{aligned}$$

$$\begin{aligned} (kA)^T &= k(A)^T \\ &= k(-A) \\ &= -kA \end{aligned}$$

- c) We need to prove from the hint that  $\frac{1}{2}(A + A^T)$  is symmetric and  $\frac{1}{2}(A - A^T)$  is skew-symmetric

$$\begin{aligned} \frac{1}{2}(A + A^T)^T &= \frac{1}{2}\left(A^T + (A^T)^T\right) \\ &= \frac{1}{2}(A + A^T) \end{aligned}$$

Thus  $\frac{1}{2}(A + A^T)$  is symmetric

$$\begin{aligned}\frac{1}{2}(A - A^T)^T &= \frac{1}{2}\left(A^T - (A^T)^T\right) \\ &= \frac{1}{2}(A^T - A) \\ &= -\frac{1}{2}(A - A^T)\end{aligned}$$

Thus  $\frac{1}{2}(A - A^T)$  is skew-symmetric

### Exercise

Suppose  $R$  is rectangular ( $m$  by  $n$ ) and  $A$  is symmetric ( $m$  by  $m$ )

- Transpose  $R^T AR$  to show its symmetric
- Show why  $R^T R$  has no negative numbers on its diagonal.

### Solution

$$\begin{aligned}a) \quad (R^T AR)^T &= \left((R^T A)R\right)^T \\ &= R^T (R^T A)^T \\ &= R^T A^T (R^T)^T \\ &= R^T AR\end{aligned}$$

$$\begin{aligned}b) \quad (R^T R)_{jj} &= (\text{column } j \text{ of } R) \cdot (\text{column } j \text{ of } R) \\ &= \text{Product of the diagonal entry by itself.} \\ &= \text{length squared of column } j.\end{aligned}$$

### Exercise

If  $L$  is a lower-triangular matrix, then  $(L^{-1})^T$  is \_\_\_\_\_ Triangular

### Solution

$(L^{-1})^T$  is **upper** triangular.

$L^{-1}$  is a lower-triangular because  $L$  is.

The transpose carries the lower-triangular matrices to the upper-triangular (and vice versa).

## Exercise

True or False

- a) The block matrix  $\begin{bmatrix} 0 & A \\ A & 0 \end{bmatrix}$  is automatically symmetric
- b) If  $A$  and  $B$  are symmetric then their product is symmetric
- c) If  $A$  is not symmetric then  $A^{-1}$  is not symmetric
- d) When  $A, B, C$  are symmetric, the transpose of  $ABC$  is  $CBA$ .
- e) The transpose of a diagonal matrix is a diagonal.
- f) The transpose of an upper triangular matrix is an upper triangular matrix.
- g) The sum of an upper triangular matrix and a lower triangular matrix is a diagonal matrix.
- h) All entries of a symmetric matrix are determined by the entries occurring on and above the main diagonal.
- i) All entries of an upper triangular matrix are determined by the entries occurring on and above the main diagonal.
- j) The inverse of an invertible lower triangular matrix is an upper triangular matrix.
- k) A diagonal matrix is invertible if and only if all of its diagonal entries are positive.
- l) The sum of a diagonal matrix and a lower triangular matrix is a lower triangular matrix.
- m) A matrix that is both symmetric and upper triangular must be a diagonal matrix.
- n) If  $A$  and  $B$  are  $n \times n$  matrices such that  $A + B$  is symmetric, then  $A$  and  $B$  are symmetric.
- o) If  $A$  and  $B$  are  $n \times n$  matrices such that  $A + B$  is upper triangular, then  $A$  and  $B$  are upper triangular.
- p) If  $A^2$  is a symmetric matrix, then  $A$  is a symmetric matrix.
- q) If  $kA$  is a symmetric matrix for some  $k \neq 0$ , then  $A$  is a symmetric matrix.

## Solution

a) **False:**  $\left( \begin{array}{cc|cc} 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 1 \\ \hline 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 \end{array} \right)$

b) **False**  $\begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 2 & 2 \end{pmatrix}$   
 $\quad \quad \quad A \quad \quad B$

c) **True** by definition.

d) **True**  $(ABC)^T = C^T (AB)^T = C^T B^T A^T = CBA$  Since  $A^T = A, B^T = B, C^T = C$

e) **True** Since a diagonal matrix must be square and have zeros off the main diagonal, its transpose is also diagonal.

f) **False** The transpose of an upper triangular matrix is lower triangular.

g) **False**  $\begin{bmatrix} 1 & 2 \\ 0 & 3 \end{bmatrix} + \begin{bmatrix} 3 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 4 & 2 \\ 1 & 4 \end{bmatrix}$

h) **True** The entries above the main diagonal determine the entries below the main diagonal in a symmetric matrix.

i) **True** in an upper triangular matrix, the series below the main diagonal are all zeros.

j) **False** The inverse of an invertible lower triangular matrix is lower triangular.

k) **False** The diagonal entries may be negative, as long as they are nonzero.

l) **True** Adding a diagonal matrix to a lower triangular matrix will not create nonzero entries above the main diagonal.

m) **True** Since the entries below the main diagonal must be zero, so also must be the entries above the main diagonal.

n) **False**  $\begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix} + \begin{bmatrix} 3 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 4 & 2 \\ 2 & 4 \end{bmatrix}$  which is symmetric

o) **False**  $\begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix} + \begin{bmatrix} 3 & 0 \\ -1 & 1 \end{bmatrix} = \begin{bmatrix} 4 & 2 \\ 0 & 4 \end{bmatrix}$  which is upper triangular.

p) **False**  $\begin{bmatrix} 1 & 0 \\ 1 & -1 \end{bmatrix}^2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

q) **True**  $(kA)^T = kA$  then

$$(kA)^T - kA = 0$$

$$kA^T - kA = 0$$

$$k(A^T - A) = 0 \text{ since } k \neq 0 \text{ then } A^T = A$$

Therefore,  $A$  is a symmetric matrix

## Exercise

Find 2 by 2 symmetric matrices  $A = A^T$  with these properties

a)  $A$  is not invertible

b)  $A$  is invertible but cannot be factored into  $LU$  (row exchanges needed)

c)  $A$  can be factored into  $LDL^T$  but not into  $LL^T$  (because of negative  $D$ )

## Solution

a)  $A = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$

b)  $A = \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}$  only need a *zero* in the diagonal.

c)  $A = LDL^T$

$$A = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} a & 0 \\ 0 & d \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$$

$$A = \begin{pmatrix} a & 0 \\ a & d \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$$

$$= \begin{pmatrix} a & a \\ a & a+d \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 1 & 2 \end{pmatrix} \rightarrow \begin{cases} a=1 \\ d=1 \end{cases}$$

$LL^T$

$$A = \begin{pmatrix} 1 & 1 \\ 1 & 0 \end{pmatrix} \rightarrow D = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

### Exercise

A group of matrices includes  $AB$  and  $A^{-1}$  if it includes  $A$  and  $B$ . “Products and inverses stay in the group.” Which of these sets are groups?

Lower triangular matrices  $L$  with 1's on the diagonal, symmetric matrices  $S$ , positive matrices  $M$ , diagonal invertible matrices  $D$ , permutation matrices  $P$ , matrices with  $Q^T = Q^{-1}$ . **Invent two more matrix groups.**

### Solution

The lower triangular matrices  $L$  with 1's on the diagonal form a group.

Clearly the product of two is a third. The Gauss-Jordan method shows that the inverse of one is another.

The symmetric matrices don't form a group. An example of the 2 symmetric matrices  $A$  and  $B$  whose product is not symmetric

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad B = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 5 \\ 3 & 5 & 6 \end{bmatrix} \quad AB = \begin{bmatrix} 2 & 4 & 5 \\ 1 & 2 & 3 \\ 3 & 5 & 6 \end{bmatrix}$$

The positive matrices do not form a group.

$$M = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \quad M^{-1} = \begin{bmatrix} 1 & -1 \\ 0 & 1 \end{bmatrix}, \text{ the inverse is not symmetric.}$$

The diagonal invertible matrices form a group.

The permutation matrices form a group.

The matrices with  $Q^T = Q^{-1}$  form a group. If  $A$  and  $B$  are two matrices, then so are  $AB$  and  $A^{-1}$ , as

$$(AB)^T = B^T A^T = B^{-1} A^{-1} = (AB)^{-1}$$

$$(A^{-1})^T = (A^T)^{-1} = A^{-1}$$

There are many more matrix groups. For example, given two, the block matrices  $\begin{pmatrix} A & 0 \\ 0 & B \end{pmatrix}$  form a

third as  $A$  ranges over the first group and  $B$  ranges over the second.

Another example is the set of all products  $cP$  where  $c$  is a nonzero scalar and  $P$  is a permutation matrix of given size.

### ***Exercise***

Write  $A = \begin{bmatrix} 1 & 2 \\ 4 & 9 \end{bmatrix}$  as the product  $EH$  of an elementary row operation matrix  $E$  and a symmetric matrix  $H$ .

### **Solution**

$$A = EH$$

$$E^{-1}A = E^{-1}EH$$

$$E^{-1}A = H$$

An elementary row operation matrix has the form  $E = \begin{pmatrix} 1 & 0 \\ x & 1 \end{pmatrix}$

The inverse is:  $E^{-1} = \begin{pmatrix} 1 & 0 \\ -x & 1 \end{pmatrix}$

$$\begin{aligned} H &= \begin{pmatrix} 1 & 0 \\ -x & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 \\ 4 & 9 \end{pmatrix} \\ &= \begin{pmatrix} 1 & 2 \\ -x+4 & -2x+9 \end{pmatrix} \end{aligned}$$

Since matrix  $H$  is symmetric, therefore:

$$-x + 4 = 2$$

$$\underline{x = 2}$$

$$\begin{pmatrix} 1 & 2 \\ 4 & 9 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 \\ 2 & 5 \end{pmatrix}$$

*Elementary    Symmetric*

### Exercise

When is the product of two symmetric matrices symmetric? Explain your answer.

#### Solution

$AB$  is symmetric iff  $AB = (AB)^T$

$$\begin{aligned} AB &= (AB)^T \\ &= B^T A^T \quad \text{\textit{A and B are symmetric}} \\ &= BA \end{aligned}$$

$AB$  is symmetric iff  $A$  and  $B$  commute

### Exercise

Express  $\left((AB)^{-1}\right)^T$  in terms of  $\left(A^{-1}\right)^T$  and  $\left(B^{-1}\right)^T$

#### Solution

$$\begin{aligned} \left((AB)^{-1}\right)^T &= \left(B^{-1}A^{-1}\right)^T \\ &= \left(A^{-1}\right)^T \left(B^{-1}\right)^T \end{aligned}$$

### Exercise

Find the transpose of the given matrix:

$$\begin{bmatrix} 8 & -1 \\ 3 & 5 \\ -2 & 5 \\ 1 & 2 \\ -3 & -5 \end{bmatrix}$$

#### Solution

$$A^T = \begin{bmatrix} 8 & 3 & -2 & 1 & -3 \\ -1 & 5 & 5 & 2 & -5 \end{bmatrix}$$

### Exercise

Show that if  $A$  is symmetric and invertible, then  $A^{-1}$  is also symmetric.

#### Solution

$A$  is symmetric and invertible, then  $A = A^T \quad AA^{-1} = I$

$$\begin{aligned}\left(A^{-1}\right)^T &= \left(A^T\right)^{-1} \\ &= A^{-1}\end{aligned}$$

$\Rightarrow A^{-1}$  is symmetric.

### Exercise

Prove that  $(AB)^T = B^T A^T$

### Solution

Let  $A = [a_{ik}]$  and  $B = [b_{kj}]$

Then the  $ij$ -entry of  $AB$  is:

$$a_{i1}b_{1j} + a_{i2}b_{2j} + \dots + a_{im}b_{mj}$$

The reverse order,  $ji$ -entry of  $(AB)^T$

Column  $j$  of  $B$  becomes row  $j$  of  $B^T$ , and row  $i$  of  $A$  becomes column  $i$  of  $A^T$ .

Thus, the  $ij$ -entry of  $B^T A^T$  is:

$$(b_{1j}, b_{2j}, \dots, b_{mj})(a_{i1}, a_{i2}, \dots, a_{im})^T = b_{1j}a_{i1} + b_{2j}a_{i2} + \dots + b_{mj}a_{im}$$

Thus  $(AB)^T = B^T A^T$

### Exercise

For the given matrix, compute  $A^T$ ,  $(A^T)^{-1}$ ,  $A^{-1}$ , and  $(A^{-1})^T$ , then compare  $(A^T)^{-1}$  and  $(A^{-1})^T$

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}$$

### Solution

$$A^T = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\left[ \begin{array}{ccc|ccc} 1 & 2 & 3 & 1 & 0 & 0 \\ 0 & 1 & 2 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right] \quad R_1 - 2R_2$$

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & -1 & 1 & -2 & 0 \\ 0 & 1 & 2 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right] \begin{array}{l} R_1 + R_3 \\ R_1 - 2R_3 \end{array}$$

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & -2 & 1 \\ 0 & 1 & 0 & 0 & 1 & -2 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right]$$

$$\left( A^T \right)^{-1} = \begin{bmatrix} 1 & -2 & 1 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & 0 & 0 \\ 2 & 1 & 0 & 0 & 1 & 0 \\ 3 & 2 & 1 & 0 & 0 & 1 \end{array} \right] \begin{array}{l} \\ R_2 - 2R_1 \\ R_3 - 3R_1 \end{array}$$

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & -2 & 1 & 0 \\ 0 & 2 & 1 & -3 & 0 & 1 \end{array} \right] R_3 - 2R_2$$

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & -2 & 1 & 0 \\ 0 & 0 & 1 & 1 & -2 & 1 \end{array} \right]$$

$$A^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & -2 & 1 \end{bmatrix}$$

$$\left( A^{-1} \right)^T = \begin{bmatrix} 1 & -2 & 1 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\left( A^T \right)^{-1} = \left( A^{-1} \right)^T$$

### Exercise

Show that a  $2 \times 2$  lower triangular matrix is invertible if and only if  $a_{11}a_{22} \neq 0$  and in this case the inverse is also lower triangular.

### Solution

Let  $A$  to be the lower triangular matrix

$$A = \begin{pmatrix} a_{11} & 0 \\ a_{21} & a_{22} \end{pmatrix}$$

$\det(A) = a_{11}a_{22} \neq 0$  is invertible iff  $a_{11}a_{22} \neq 0$  and then

$$A^{-1} = \frac{1}{a_{11}a_{22}} \begin{pmatrix} a_{22} & 0 \\ -a_{21} & a_{11} \end{pmatrix}$$

$$= \begin{pmatrix} \frac{1}{a_{11}} & 0 \\ -\frac{a_{21}}{a_{11}a_{22}} & \frac{1}{a_{22}} \end{pmatrix}$$

### ***Exercise***

Let  $A$  be any  $2 \times 2$  diagonal matrix. Give a necessary and sufficient condition on the diagonal entries so that  $A$  has an inverse. Compute the inverse of any such matrix.

### **Solution**

$$\text{Let } A = \begin{pmatrix} a_{11} & 0 \\ 0 & a_{22} \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} \frac{1}{a_{11}} & 0 \\ 0 & \frac{1}{a_{22}} \end{pmatrix}$$

So,  $A^{-1}$  exists when both entries on the main diagonal are nonzero.
