

Lecture Three – Laplace and Linear Systems

Section 3.1 – Definition of the Laplace Transform

Definition

Suppose $f(t)$ is a function of t defined for $0 < t < \infty$. The **Laplace transform** of f is the function

$$\mathcal{L}(f)(s) = F(s) = \int_0^{\infty} f(t)e^{-st} dt$$

The integral of the Laplace transform is an improper integral because the upper limit is ∞ .

$$F(s) = \int_0^{\infty} f(t)e^{-st} dt = \lim_{T \rightarrow \infty} \int_0^T f(t)e^{-st} dt$$

Example

Assume $f(t) = e^{at}$

Solution

$$\begin{aligned} F(s) &= \int_0^{\infty} e^{at} e^{-st} dt \\ &= \int_0^{\infty} e^{-(s-a)t} dt \end{aligned}$$

$$F(s) = \lim_{T \rightarrow \infty} \int_0^T e^{-(s-a)t} dt$$

$$= \lim_{T \rightarrow \infty} \left. \frac{-e^{-(s-a)t}}{s-a} \right|_0^T$$

$$e^{-(s-a)0} = 1$$

$$= \lim_{T \rightarrow \infty} \left(\frac{-e^{-(s-a)T}}{s-a} + \frac{1}{s-a} \right)$$

$$e^{-(s-a)\infty} = \frac{1}{e^{\infty}} = 0$$

$$dv = \int e^{-st} dt = \frac{1}{s-a}$$

$$\mathcal{L}(e^{at})(s) = F(s) = \frac{1}{s-a} \quad \text{for } s > a$$

Example

Assume $f(t) = t$

Solution

$$F(s) = \int_0^{\infty} te^{-st} dt$$

$$u = t$$

$$du = dt \quad v = -\frac{1}{s}e^{-st}$$

$$\int te^{-st} dt = -\frac{1}{s}te^{-st} - \int \left(-\frac{1}{s}\right)e^{-st} dt$$

$$= -\frac{1}{s}te^{-st} + \frac{1}{s} \int e^{-st} dt$$

$$= -\frac{1}{s}te^{-st} + \frac{1}{s} \left(-\frac{1}{s}\right)e^{-st}$$

$$= -\frac{1}{s}te^{-st} - \frac{1}{s^2}e^{-st}$$

$$F(s) = \lim_{T \rightarrow \infty} \left(-\frac{1}{s}te^{-st} - \frac{1}{s^2}e^{-st} \right)_{t=0}^T$$

$$= \lim_{T \rightarrow \infty} \left(-\frac{1}{s}Te^{-sT} - \frac{1}{s^2}e^{-sT} + \frac{1}{s^2} \right)$$

$$= \frac{1}{s^2}$$

$$\lim_{T \rightarrow \infty} \left(e^{-sT} \right) = 0$$

Laplace transform to any power t^n

$$\mathcal{L}(t^n)(s) = \frac{n!}{s^{n+1}}$$

Example

Assume $f(t) = \sin at$

Solution

$$F(s) = \int_0^{\infty} e^{-st} \sin at \, dt$$

$$u = e^{-st} \quad dv = \int \sin at \, dt$$

$$du = -se^{-st} dt \quad v = -\frac{1}{a} \cos at$$

$$\begin{aligned} \int e^{-st} \sin at \, dt &= -\frac{1}{a} e^{-st} \cos at - \int \left(-\frac{1}{a} \cos at \right) \left(-se^{-st} \right) dt \\ &= -\frac{1}{a} e^{-st} \cos at - \frac{s}{a} \int \left(e^{-st} \cos at \right) dt \end{aligned}$$

$$\begin{aligned} \int \left(e^{-st} \cos at \right) dt \quad u = e^{-st} \quad dv = \int \cos at \, dt \\ du = -se^{-st} dt \quad v = \frac{1}{a} \sin at \end{aligned}$$

$$\int e^{-st} \sin at \, dt = -\frac{1}{a} e^{-st} \cos at - \frac{s}{a} \left[\frac{1}{a} e^{-st} \sin at - \frac{1}{a} \int \left(-se^{-st} \right) (\sin at) \, dt \right]$$

$$\int e^{-st} \sin at \, dt = -\frac{1}{a} e^{-st} \cos at - \frac{s}{a^2} e^{-st} \sin at - \frac{s^2}{a^2} \int e^{-st} \sin at \, dt$$

$$\int e^{-st} \sin at \, dt + \frac{s^2}{a^2} \int e^{-st} \sin at \, dt = -\frac{1}{a} e^{-st} \cos at - \frac{s}{a^2} e^{-st} \sin at$$

$$\frac{a^2 + s^2}{a^2} \int e^{-st} \sin at \, dt = -\frac{1}{a} e^{-st} \cos at - \frac{s}{a^2} e^{-st} \sin at$$

$$\int e^{-st} \sin at \, dt = -\frac{ae^{-st}}{a^2 + s^2} \cos at - \frac{se^{-st}}{a^2 + s^2} \sin at$$

$$F(s) = \lim_{T \rightarrow \infty} \int_0^T e^{-st} \sin at \, dt$$

$$= \lim_{T \rightarrow \infty} \left(\left(-\frac{ae^{-sT}}{a^2 + s^2} \cos aT - \frac{se^{-sT}}{a^2 + s^2} \sin aT \right) - \left(-\frac{ae^{-s(0)}}{a^2 + s^2} \cos a(0) - \frac{se^{-s(0)}}{a^2 + s^2} \sin a(0) \right) \right)$$

$$= \lim_{T \rightarrow \infty} \left(\left(-\frac{ae^{-sT}}{a^2 + s^2} \cos aT - \frac{se^{-sT}}{a^2 + s^2} \sin aT \right) - \left(-\frac{a}{a^2 + s^2} \right) \right)$$

$$= \lim_{T \rightarrow \infty} \left(-\frac{ae^{-sT}}{a^2 + s^2} \cos aT - \frac{se^{-sT}}{a^2 + s^2} \sin aT \right) + \frac{a}{a^2 + s^2}$$

$$\lim_{T \rightarrow \infty} \left(e^{-sT} \right) = 0$$

$$= \frac{a}{a^2 + s^2}$$

Exercises **Section 3.1 - The Definition of the Laplace Transform**

Use Definition of Laplace transform to find the Laplace transform of:

- | | | |
|----------------------------|--------------------------|-----------------------------|
| 1. $f(t) = 3$ | 9. $f(t) = \sin 3t$ | 17. $f(t) = e^{-t} \sin t$ |
| 2. $f(t) = t$ | 10. $f(t) = \sin 2t$ | 18. $f(t) = e^{2t} \cos 3t$ |
| 3. $f(t) = t^2$ | 11. $f(t) = \cos 2t$ | 19. $f(t) = e^{-t} \sin 2t$ |
| 4. $f(t) = e^{6t}$ | 12. $f(t) = \cos bt$ | 20. $f(t) = t \sin t$ |
| 5. $f(t) = e^{-2t}$ | 13. $f(t) = e^{t+7}$ | 21. $f(t) = t \cos t$ |
| 6. $f(t) = te^{-3t}$ | 14. $f(t) = e^{-2t-5}$ | 22. $f(t) = 2t^4$ |
| 7. $f(t) = te^{3t}$ | 15. $f(t) = te^{4t}$ | |
| 8. $f(t) = e^{2t} \cos 3t$ | 16. $f(t) = t^2 e^{-2t}$ | |

Use Definition of Laplace transform to show the Laplace transform of

23. $f(t) = \cos \omega t$ is $F(s) = \frac{s}{s^2 + \omega^2}$
