

Lecture Two – Partial Derivatives

Section 2.1 – Graphs and Level Curves

Definitions

Suppose D is a set of n -tuples of real numbers (x_1, x_2, \dots, x_n) . A **real-valued function** f on D is a rule that assigns a unique (single) real number

$$w = f(x_1, x_2, \dots, x_n)$$

To each element in D . The set D is the function's **domain**. The set of w -values taken on by f is the function's **range**. The symbol w is the **dependent variable** of f , and f is said to be a function of the n **independent variables** x_1 to x_n . We also call the x_j 's the function's **input variables** and call w the function's **output variable**.

Domains and Ranges

Functions of two variables

Function	Domain	Range
$z = \sqrt{y - x^2}$	$y \geq x^2$	$[0, \infty)$
$z = \frac{1}{xy}$	$xy \neq 0$	$(-\infty, 0) \cup (0, \infty)$
$z = \sin xy$	Entire plane	$[-1, 1]$

Functions of three variables

<i>Function</i>	<i>Domain</i>	<i>Range</i>
$w = \sqrt{x^2 + y^2 + z^2}$	Entire plane	$[0, \infty)$
$w = \frac{1}{x^2 + y^2 + z^2}$	$(x, y, z) \neq (0, 0, 0)$	$(0, \infty)$
$w = xy \ln z$	Half-space $z > 0$	$(-\infty, \infty)$

Functions of Two Variables

Definitions

A point (x_0, y_0) in a region (set) R in the xy -plane is an **interior point** of R if it is the center of a disk of positive radius that lies entirely in R . A point (x_0, y_0) is a **boundary point** of R if every disk centered at (x_0, y_0) contains points that lie outside of R as well as points that lie in R . (The boundary point itself need not belong to R .)

The interior points of a region, as a set, make up the **interior** of the region. The region's boundary points make up its **boundary**. A region is **open** if it consists entirely of interior points. A region is **closed** if it contains all its boundary points.

Interior point

Boundary point

$$x^2 + y^2 < 1$$

Open unit disk

$$x^2 + y^2 = 1$$

Boundary of unit disk

$$x^2 + y^2 \leq 1$$

Closed unit disk

Definitions

A region in the plane is **bounded** if it lies inside a disk of fixed radius. A region is **unbounded** if it is not bounded.

Graphs, Level Curves, and contours of Functions of two Variables

Definitions

The set of points in the plane where a function $f(x, y) = c$ is called a **level curve** of f . The set of all points $(x, y, f(x, y))$ in space, for (x, y) in the domain of f , is called the **graph** of f . The graph of f is also called the **surface** $z = f(x, y)$.

Example

Graph $f(x, y) = 100 - x^2 - y^2$ and plot the level curves $f(x, y) = 0$, $f(x, y) = 51$, and $f(x, y) = 75$ in the domain of f in the plane.

Solution

The domain of f is the entire xy -plane, and the range of f is the set of real numbers less than or equal to 100.

The graph is the paraboloid $z = 100 - x^2 - y^2$, the positive portion of which is shown in the picture.

$$\text{At } f(x, y) = 0 \Rightarrow x^2 + y^2 = 100$$

Which is the circle of radius 10 centered at the origin (level curve).

$$\text{At } f(x, y) = 51 \Rightarrow x^2 + y^2 = 49$$

Which is the circle of radius 7 centered at the origin.

$$\text{At } f(x, y) = 75 \Rightarrow x^2 + y^2 = 25$$

Which is the circle of radius 5 centered at the origin.

If $x^2 + y^2 > 100$, then the values of $f(x, y)$ are negative.

The contour curve $f(x, y) = 100 - x^2 - y^2 = 75$ is the circle $x^2 + y^2 = 25$ in the plane $z = 75$.

The level curve $f(x, y) = 100 - x^2 - y^2 = 75$ is the circle $x^2 + y^2 = 25$ in the xy -plane.

Functions of Three Variables

Definition

The set of points (x, y, z) in space where a function of three independent variables has a constant value $f(x, y, z) = c$ is called a **level surface** of f .

Example

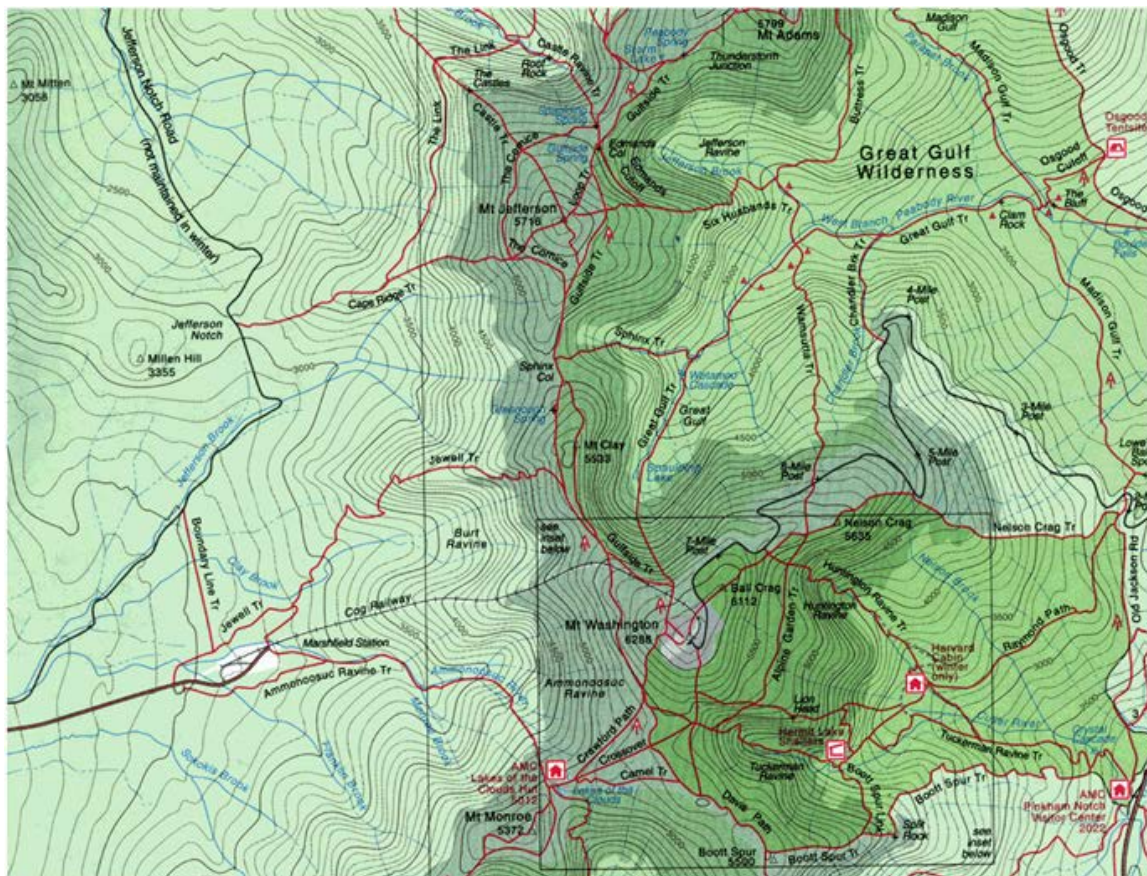

Describe the level surfaces of the function

$$f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$$

Solution

The value of f is the distance from the origin to the point (x, y, z) .

Each surface $\sqrt{x^2 + y^2 + z^2} = c$ (> 0), is a sphere of radius c centered at the origin.

Definitions

A point (x_0, y_0, z_0) in a region R in space is an **interior point** of R if it is the center of a solid ball that lies entirely in R . A point (x_0, y_0, z_0) is a **boundary point** of R if every solid ball centered at (x_0, y_0, z_0) contains points that lie outside of R as well as that lie inside R . The **interior** of R is the set of interior points of R . The **boundary** of R is the set of boundary points of R .

A region is **open** if it consists entirely of interior points. A region is **closed** if it contains its entire boundary.

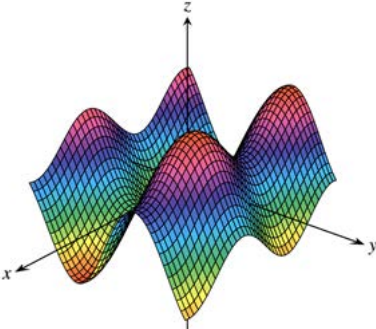

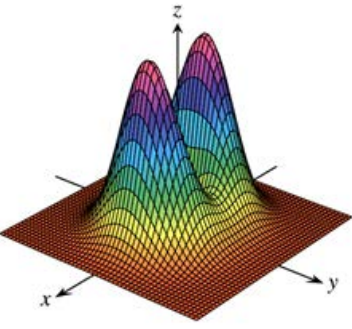

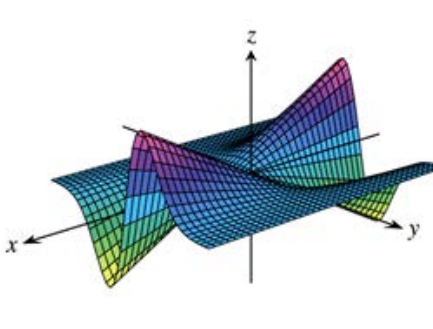

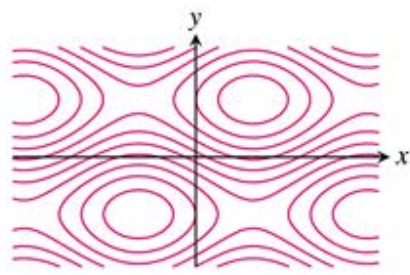

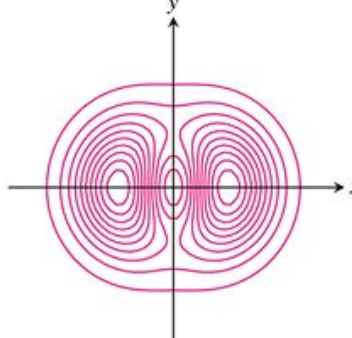

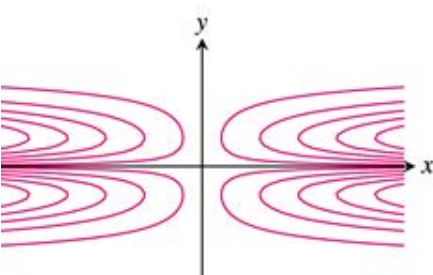

Example

The temperature w beneath the Earth's surface is a function of the depth x beneath the surface and the time t of the year. If we measure x in feet and t as the number of days elapsed from the expected date of the yearly highest surface temperature, we can model the variation in temperature with the function

$$w = \cos(1.7 \times 10^{-2}t - 0.2x)e^{-0.2x}$$

The temperature at 9 ft is scaled to vary from +1 to -1, so that the variation at x ft. can be interpreted as a fraction of the variation at the surface.

		
		
$z = \sin x + 2 \sin y$	$z = (4x^2 + y^2)e^{-x^2 - y^2}$	$z = xye^{-y^2}$

Exercises Section 2.1 – Graphs and Level Curves

1. Find the specific values for $f(x, y, z) = \frac{x-y}{y^2+z^2}$
 - a) $f(3, -1, 2)$
 - b) $f\left(1, \frac{1}{2}, -\frac{1}{4}\right)$
 - c) $f\left(0, -\frac{1}{3}, 0\right)$
 - d) $f(2, 2, 100)$
2. Find the specific values for $f(x, y, z) = \sqrt{49 - x^2 - y^2 - z^2}$
 - a) $f(0, 0, 0)$
 - b) $f(2, -3, 6)$
 - c) $f(-1, 2, 3)$
 - d) $f\left(\frac{4}{\sqrt{2}}, \frac{5}{\sqrt{2}}, \frac{6}{\sqrt{2}}\right)$
- (3 – 11) Find and sketch the domain for each function
 3. $f(x, y) = \sqrt{y - x - 2}$
 4. $f(x, y) = \ln(x^2 + y^2 - 4)$
 5. $f(x, y) = \frac{\sin(xy)}{x^2 + y^2 - 25}$
 6. $f(x, y) = \ln(xy + x - y - 1)$
 7. $f(x, y) = \sqrt{(x^2 - 4)(y^2 - 9)}$
 8. $f(x, y) = \frac{1}{x^2 + y^2}$
 9. $f(x, y) = \ln xy$
 10. $f(x, y) = \sqrt{x - y^2}$
 11. $f(x, y) = \tan(x + y)$
- (12 – 13) Find and sketch the level curves $f(x, y) = c$ on the same set of coordinate axes for the given values of c , we refer to these level curves as a contour map.
 12. $f(x, y) = x + y - 1, \quad c = -3, -2, -1, 0, 1, 2, 3$
 13. $f(x, y) = x^2 + y^2, \quad c = 0, 1, 4, 9, 16, 25$
14. For the function: $f(x, y) = 4x^2 + 9y^2$:
 - a) Find the function's domain
 - b) Find the function's range
 - c) Find the function's level curves
 - d) Find the boundary of the function's domain
 - e) Determine if the domain is an open region, a closed region, or neither
 - f) Decide if the domain is bounded or unbounded
15. For the function: $f(x, y) = xy$:
 - a) Find the function's domain
 - b) Find the function's range
 - c) Find the function's level curves

- d) Find the boundary of the function's domain
- e) Determine if the domain is an open region, a closed region, or neither
- f) Decide if the domain is bounded or unbounded

16. For the function: $f(x, y) = e^{-(x^2 + y^2)}$:

- a) Find the function's domain
- b) Find the function's range
- c) Find the function's level curves
- d) Find the boundary of the function's domain
- e) Determine if the domain is an open region, a closed region, or neither
- f) Decide if the domain is bounded or unbounded

17. For the function: $f(x, y) = \ln(9 - x^2 - y^2)$:

- a) Find the function's domain
- b) Find the function's range
- c) Find the function's level curves
- d) Find the boundary of the function's domain
- e) Determine if the domain is an open region, a closed region, or neither
- f) Decide if the domain is bounded or unbounded

18. Find an equation for $f(x, y) = 16 - x^2 - y^2$ and sketch the graph of the level curve of the function $f(x, y)$ that passes through the point $(2\sqrt{2}, \sqrt{2})$

19. Find an equation for $f(x, y) = \frac{2y - x}{x + y + 1}$ and sketch the graph of the level curve of the function $f(x, y)$ that passes through the point $(-1, 1)$

(20 – 23) Sketch a typical level surface for the function

20. $f(x, y, z) = x^2 + y^2 + z^2$

22. $f(x, y, z) = y^2 + z^2$

21. $f(x, y, z) = \ln(x^2 + y^2 + z^2)$

23. $f(x, y, z) = z - x^2 - y^2$

Section 2.2 – Limits and Continuity

Definition

We say that a function $f(x, y)$ approaches the limit L , as (x, y) approaches (x_0, y_0) , and write

$$\lim_{(x, y) \rightarrow (x_0, y_0)} f(x, y) = L$$

If, for every number $\varepsilon > 0$, there exists a corresponding number $\delta > 0$ such that for all (x, y) in the domain of f .

$$|f(x, y) - L| < \varepsilon \quad \text{whenever} \quad 0 < \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta$$

Theorem

The following rules hold if L, M, K are real numbers and

$$\lim_{(x, y) \rightarrow (x_0, y_0)} f(x, y) = L \quad \text{and} \quad \lim_{(x, y) \rightarrow (x_0, y_0)} g(x, y) = M$$

Sum Rule:

$$\lim_{(x, y) \rightarrow (x_0, y_0)} (f(x, y) + g(x, y)) = L + M$$

Difference Rule:

$$\lim_{(x, y) \rightarrow (x_0, y_0)} (f(x, y) - g(x, y)) = L - M$$

Constant Multiple Rule:

$$\lim_{(x, y) \rightarrow (x_0, y_0)} kf(x, y) = kL$$

Product Rule:

$$\lim_{(x, y) \rightarrow (x_0, y_0)} (f(x, y) \cdot g(x, y)) = L \cdot M$$

Quotient Rule:
$$\lim_{(x,y) \rightarrow (x_0, y_0)} \frac{f(x, y)}{g(x, y)} = \frac{L}{M}$$

Power Rule:
$$\lim_{(x,y) \rightarrow (x_0, y_0)} [f(x, y)]^n = L^n \quad (n \text{ a positive integer})$$

Root Rule:
$$\lim_{(x,y) \rightarrow (x_0, y_0)} \sqrt[n]{f(x, y)} = \sqrt[n]{L} = L^{1/n} \quad (n \text{ a positive integer})$$

Example

Find
$$\lim_{(x,y) \rightarrow (0,1)} \frac{x - xy + 3}{x^2y + 5xy - y^3}$$

Solution

$$\lim_{(x,y) \rightarrow (0,1)} \frac{x - xy + 3}{x^2y + 5xy - y^3} = \frac{0 - (0)(1) + 3}{(0)^2(1) + 5(0)(1) - (1)^3} = -3$$

Example

Find
$$\lim_{(x,y) \rightarrow (3,-4)} \sqrt{x^2 + y^2}$$

Solution

$$\lim_{(x,y) \rightarrow (3,-4)} \sqrt{x^2 + y^2} = \sqrt{(3)^2 + (-4)^2} = 5$$

Example

Find
$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 - xy}{\sqrt{x} - \sqrt{y}}$$

Solution

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 - xy}{\sqrt{x} - \sqrt{y}} = \frac{0}{0}$$

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 - xy}{\sqrt{x} - \sqrt{y}} \cdot \frac{\sqrt{x} + \sqrt{y}}{\sqrt{x} + \sqrt{y}} = \lim_{(x,y) \rightarrow (0,0)} \frac{x(x - y)(\sqrt{x} + \sqrt{y})}{x - y}$$

$$= \lim_{(x,y) \rightarrow (0,0)} x(\sqrt{x} + \sqrt{y})$$

$$= 0$$

Definition

A function $f(x, y)$ is **continuous at the point** (x_0, y_0) if

1. f is defined at (x_0, y_0)
2. $\lim_{(x,y) \rightarrow (x_0, y_0)} f(x, y)$ exists
3. $\lim_{(x,y) \rightarrow (x_0, y_0)} f(x, y) = f(x_0, y_0)$

A function is **continuous** if it is continuous at every point of its domain.

Two-Path Test for Nonexistence of a Limit

If a function $f(x, y)$ has different limits along two different paths in the domain of f as (x, y) approaches (x_0, y_0) , then $\lim_{(x,y) \rightarrow (x_0, y_0)} f(x, y)$ does not exist.

Example

Show that the function $f(x, y) = \frac{2x^2y}{x^4 + y^2}$ has no limit as (x, y) approaches $(0, 0)$

Solution

$$\lim_{(x, y) \rightarrow (0, 0)} \frac{2x^2y}{x^4 + y^2} = \frac{0}{0}$$

We examine the curve $y = kx^2$, $x \neq 0$

$$\begin{aligned} \left. \frac{2x^2y}{x^4 + y^2} \right|_{y=kx^2} &= \frac{2x^2(kx^2)}{x^4 + (kx^2)^2} \\ &= \frac{2kx^4}{x^4 + k^2x^4} \\ &= \frac{2kx^4}{x^4(1 + k^2)} \\ &= \frac{2k}{1 + k^2} \end{aligned}$$

$$\lim_{\substack{(x, y) \rightarrow (0, 0) \\ \text{along } y=kx^2}} f(x, y) = \frac{2k}{1 + k^2}$$

This limit varies with the path of approach. If (x, y) approaches $(0, 0)$ along the parabola $y = x^2$.

Continuity of Composites

If f is continuous at (x_0, y_0) and g is a single-variable function continuous at $f(x_0, y_0)$, then the composite function $h = g \circ f$ defined by $h(x, y) = g(f(x, y))$ is continuous at (x_0, y_0) .

Functions of More Than Two Variables

The definitions of limit and continuity for functions of two variables and the conclusions about limits and continuity for sums, products, quotients, powers, and composites all extend to functions of three or more variables. Functions like

$$\ln(x + y + z) \quad \text{and} \quad \frac{y \sin z}{x - 1}$$

Exercises Section 2.2 – Limits and Continuity

(1 – 24) Find the limit

1. $\lim_{(x,y) \rightarrow (0,0)} \frac{3x^2 - y^2 + 5}{x^2 + y^2 + 2}$

2. $\lim_{(x,y) \rightarrow (0,4)} \frac{x}{\sqrt{y}}$

3. $\lim_{(x,y) \rightarrow (3,4)} \sqrt{x^2 + y^2 - 1}$

4. $\lim_{(x,y) \rightarrow (0,0)} \cos \frac{x^2 + y^3}{x + y + 1}$

5. $\lim_{(x,y) \rightarrow (0,0)} \frac{e^y \sin x}{x}$

6. $\lim_{(x,y) \rightarrow (\frac{\pi}{2}, 0)} \frac{\cos y + 1}{y - \sin x}$

7. $\lim_{\substack{(x,y) \rightarrow (1,1) \\ x \neq y}} \frac{x^2 - 2xy + y^2}{x - y}$

8. $\lim_{\substack{(x,y) \rightarrow (1,1) \\ x \neq y}} \frac{x^2 - y^2}{x - y}$

9. $\lim_{\substack{(x,y) \rightarrow (2,-4) \\ x \neq x^2, y \neq -4}} \frac{y + 4}{x^2 y - xy + 4x^2 - 4x}$

10. $\lim_{\substack{(x,y) \rightarrow (4,3) \\ x \neq y+1}} \frac{\sqrt{x} - \sqrt{y+1}}{x - y - 1}$

11. $\lim_{(x,y) \rightarrow (1,-1)} \frac{x^3 + y^3}{x + y}$

12. $\lim_{(x,y) \rightarrow (2,2)} \frac{x - y}{x^4 - y^4}$

13. $\lim_{P \rightarrow (1,3,4)} \left(\frac{1}{x} + \frac{1}{y} + \frac{1}{z} \right)$

14. $\lim_{P \rightarrow (1,-1,-1)} \frac{2xy + yz}{x^2 + z^2}$

15. $\lim_{P \rightarrow (\pi, 0, 2)} ze^{-2y} \cos 2x$

16. $\lim_{P \rightarrow (2,-3,6)} \ln \sqrt{x^2 + y^2 + z^2}$

17. $\lim_{(x,y) \rightarrow (4,-2)} (10x - 5y + 6xy)$

18. $\lim_{(x,y) \rightarrow (1,1)} \frac{xy}{x + y}$

19. $\lim_{(x,y) \rightarrow (0,0)} \frac{x + y}{xy}$

20. $\lim_{(x,y) \rightarrow (0,0)} \frac{\sin xy}{x^2 + y^2}$

21. $\lim_{(x,y) \rightarrow (-1,1)} \frac{x^2 - y^2}{x^2 - xy - 2y^2}$

22. $\lim_{(x,y) \rightarrow (1,2)} \frac{x^2 y}{x^4 + 2y^2}$

23. $\lim_{(x,y,z) \rightarrow (\frac{\pi}{2}, 0, \frac{\pi}{2})} 4 \cos y \sin \sqrt{xz}$

24. $\lim_{(x,y,z) \rightarrow (5,2,-3)} \tan^{-1} \left(\frac{x + y^2}{z^2} \right)$

(25 – 30) At what points (x, y, z) in space are the functions continuous

25. $f(x, y, z) = x^2 + y^2 - 2z^2$

28. $f(x, y, z) = e^{x+y} \cos z$

26. $f(x, y, z) = \sqrt{x^2 + y^2 - 1}$

29. $h(x, y, z) = \frac{1}{|y| + |z|}$

27. $f(x, y, z) = \ln(xyz)$

30. $h(x, y, z) = \frac{1}{z - \sqrt{x^2 + y^2}}$

Section 2.3 – Partial Derivatives

Partial Derivatives of a Function of Two Variables

We define the partial derivative of f with respect to x at the point (x_0, y_0) as the ordinary derivative of $f(x, y_0)$ with respect to x at the point $x = x_0$.

To distinguish partial derivatives from ordinary derivatives we use the symbol ∂ **rather** than the **d** symbol.

Definition

The **partial derivative** of $f(x, y)$ with **respect to** x at the point (x_0, y_0) is

$$\left. \frac{\partial f}{\partial x} \right|_{(x_0, y_0)} = \lim_{h \rightarrow 0} \frac{f(x_0 + h, y_0) - f(x_0, y_0)}{h}$$

provided the limit exists.

Definition

The **partial derivative** of $f(x, y)$ with **respect to** y at the point (x_0, y_0) is

$$\left. \frac{\partial f}{\partial y} \right|_{(x_0, y_0)} = \lim_{h \rightarrow 0} \frac{f(x_0, y_0 + h) - f(x_0, y_0)}{h}$$

provided the limit exists.

The partial derivative with respect to y is denoted:

$$\frac{\partial f}{\partial y}(x_0, y_0), \quad f_y(x_0, y_0), \quad \frac{\partial f}{\partial y}, \quad f_y$$

Calculations

Example

Find the values of $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$ at the point $(4, -5)$ if $f(x, y) = x^2 + 3xy + y - 1$

Solution

$$\begin{aligned}\frac{\partial f}{\partial x} &= \frac{\partial}{\partial x}(x^2 + 3xy + y - 1) \\ &= 2x + 3y \quad | \end{aligned}$$

$$\begin{aligned}\frac{\partial f}{\partial x} \Big|_{(4, -5)} &= 2(4) + 3(-5) \\ &= -7 \quad | \end{aligned}$$

$$\begin{aligned}\frac{\partial f}{\partial y} &= \frac{\partial}{\partial y}(x^2 + 3xy + y - 1) \\ &= 3x + 1 \quad | \end{aligned}$$

$$\begin{aligned}\frac{\partial f}{\partial y} \Big|_{(4, -5)} &= 3(4) + 1 \\ &= 13 \quad | \end{aligned}$$

Example

Find $\frac{\partial f}{\partial y}$ as a function if $f(x, y) = y \sin xy$

Solution

$$\begin{aligned}\frac{\partial f}{\partial y} &= \frac{\partial}{\partial y}(y \sin xy) \\ &= \sin xy \frac{\partial}{\partial y}(y) + y \frac{\partial}{\partial y}(\sin xy) \\ &= \sin xy + (y \cos xy) \frac{\partial}{\partial y}(xy) \\ &= \sin xy + xy \cos xy \quad | \end{aligned}$$

Example

Find f_x and f_y as a function if $f(x, y) = \frac{2y}{y + \cos x}$

Solution

$$\begin{aligned} f_x &= \frac{\partial}{\partial x} \left(\frac{2y}{y + \cos x} \right) & \left(\frac{u}{v} \right)' &= \frac{u'v - v'u}{v^2} \\ &= \frac{(y + \cos x) \frac{\partial}{\partial x} (2y) - (2y) \frac{\partial}{\partial x} (y + \cos x)}{(y + \cos x)^2} \\ &= \frac{(y + \cos x)(0) - 2y(-\sin x)}{(y + \cos x)^2} \\ &= \frac{2y \sin x}{(y + \cos x)^2} \end{aligned}$$

$$\begin{aligned} f_y &= \frac{\partial}{\partial y} \left(\frac{2y}{y + \cos x} \right) & \left(\frac{u}{v} \right)' &= \frac{u'v - v'u}{v^2} \\ &= \frac{(y + \cos x)(2) - (2y)(1)}{(y + \cos x)^2} \\ &= \frac{2y + 2\cos x - 2y}{(y + \cos x)^2} \\ &= \frac{2\cos x}{(y + \cos x)^2} \end{aligned}$$

OR

$$\begin{aligned} f_x &= \frac{\partial}{\partial x} \left(\frac{2y}{\cos x + y} \right) & \left(\frac{ay + b}{cy + d} \right)' &= \frac{ady' - bcy'}{(cy + d)^2} \\ &= \frac{2y \sin x}{(y + \cos x)^2} \end{aligned}$$

$$\begin{aligned} f_y &= \frac{\partial}{\partial y} \left(\frac{2y}{y + \cos x} \right) & \left(\frac{ay + b}{cy + d} \right)' &= \frac{ad - bc}{(cy + d)^2} \\ &= \frac{2\cos x}{(y + \cos x)^2} \end{aligned}$$

Example

Find $\frac{\partial z}{\partial x}$ if the equation $yz - \ln z = x + y$ defines z as a function of the two independent variables x and y and the partial derivative exist.

Solution

$$\frac{\partial}{\partial x}(yz) - \frac{\partial}{\partial x} \ln z = \frac{\partial x}{\partial x} + \frac{\partial y}{\partial x}$$

$$y \frac{\partial z}{\partial x} - \frac{1}{z} \frac{\partial z}{\partial x} = 1 + 0$$

$$\left(y - \frac{1}{z}\right) \frac{\partial z}{\partial x} = 1$$

$$\left(\frac{yz - 1}{z}\right) \frac{\partial z}{\partial x} = 1$$

$$\frac{\partial z}{\partial x} = \frac{z}{yz - 1}$$

Example

The plane $x = 1$ intersects the paraboloid $z = x^2 + y^2$ in a parabola. Find the slope of the tangent to the parabola at $(1, 2, 5)$.

Solution

The slope is the value of the partial derivative $\frac{\partial z}{\partial y}$ at $(1, 2)$

$$\frac{\partial z}{\partial y} \Big|_{(1,2)} = \frac{\partial}{\partial y} (x^2 + y^2) \Big|_{(1,2)}$$

$$= 2y \Big|_{(1,2)}$$

$$= 4$$

The plane $x = 1$ intersects the paraboloid $z = x^2 + y^2$ in a parabola. $\Rightarrow z = 1 + y^2$

$$\frac{\partial z}{\partial y} \Big|_{y=2} = \frac{\partial}{\partial y} (1 + y^2) \Big|_{y=2}$$

$$= 2y \Big|_{y=2}$$

$$= 4$$

Functions of More than Two Variables

The partial derivatives of more than two variables are ordinary derivatives with respect to one variable, taken while the other independent variables are held constant.

Example

If x , y , and z are independent variables and $f(x, y, z) = x \sin(y + 3z)$.

Find $\frac{\partial f}{\partial x}$, $\frac{\partial f}{\partial y}$, $\frac{\partial f}{\partial z}$

Solution

$$\begin{aligned}\frac{\partial f}{\partial x} &= \frac{\partial}{\partial x}(x \sin(y + 3z)) \\ &= \sin(y + 3z) \quad | \end{aligned}$$

$$\begin{aligned}\frac{\partial f}{\partial y} &= \frac{\partial}{\partial y}(x \sin(y + 3z)) \\ &= x \cos(y + 3z) \quad | \end{aligned}$$

$$\begin{aligned}\frac{\partial f}{\partial z} &= \frac{\partial}{\partial z}(x \sin(y + 3z)) \\ &= 3x \cos(y + 3z) \quad | \end{aligned}$$

Example

If resistors of R_1 , R_2 , and R_3 ohms are connected in parallel to make an R -ohm resistor, the value of R can be found from the equation.

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

Find the value of $\frac{\partial R}{\partial R_2}$ when $R_1 = 30 \Omega$, $R_2 = 45 \Omega$, and $R_3 = 90 \Omega$

Solution

$$\frac{\partial}{\partial R_2} \left(\frac{1}{R} \right) = \frac{\partial}{\partial R_2} \left(\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} \right)$$

$$-\frac{1}{R^2} \frac{\partial R}{\partial R_2} = \frac{\partial}{\partial R_2} \left(\frac{1}{R_2} \right)$$

$$-\frac{1}{R^2} \frac{\partial R}{\partial R_2} = -\frac{1}{R_2^2}$$

$$\frac{\partial R}{\partial R_2} = \frac{R^2}{R_2^2} = \left(\frac{R}{R_2} \right)^2$$

$$\frac{1}{R} = \frac{1}{30} + \frac{1}{45} + \frac{1}{90} = \frac{6}{90} = \frac{1}{15}$$

$$\Rightarrow R = 15$$

$$\frac{\partial R}{\partial R_2} = \left(\frac{15}{45} \right)^2$$

$$= 4$$

A small change in the resistance R_2 leads to a change in R about $\frac{1}{9}th$ as large.

Partial Derivatives and Continuity

Example

Let $f(x, y) = \begin{cases} 0, & xy \neq 0 \\ 1, & xy = 0 \end{cases}$

- Find the limit of f as (x, y) approaches $(0, 0)$ along the line $y = x$.
- Prove that f is not continuous at the origin.
- Show that both partial derivatives $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$ exist at the origin.

Solution

- Since $f(x, y)$ is constantly zero along the line $y = x$ (except at the origin)

$$\lim_{(x,y) \rightarrow (0,0)} f(x, y) \Big|_{y=x} = \lim_{(x,y) \rightarrow (0,0)} 0$$

$$\underline{= 0}$$

- Since $f(0, 0) = 1$, and the limit proves that f is **not** continuous at $(0, 0)$.

- $\frac{\partial f}{\partial x} \Big|_{(0,0)} = \frac{\partial}{\partial x} 1 \Big|_{(0,0)} \underline{= 0}$ is the slope of the line at any x .

The slope of the line at any y , $\frac{\partial f}{\partial y} \Big|_{(0,0)} \underline{= 0}$

Second-Order Partial Derivatives

The second-order derivatives are denoted by

$$\frac{\partial^2 f}{\partial x^2} \text{ or } f_{xx}, \quad \frac{\partial^2 f}{\partial y \partial x} \text{ or } f_{xy}, \quad \frac{\partial^2 f}{\partial y^2} \text{ or } f_{yy}, \quad \text{and} \quad \frac{\partial^2 f}{\partial x \partial y} \text{ or } f_{yx}$$

$$\frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial x} \right), \quad \frac{\partial^2 f}{\partial y \partial x} = \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right)$$

$$\frac{\partial^2 f}{\partial y \partial x} \text{ or } f_{xy} = (f_x)_y \quad \text{Differentiate first with respect to } x, \text{ then with respect to } y.$$

Example

If $f(x, y) = x \cos y + ye^x$. Find the second derivatives $\frac{\partial^2 f}{\partial x^2}$, $\frac{\partial^2 f}{\partial y \partial x}$, $\frac{\partial^2 f}{\partial y^2}$, and $\frac{\partial^2 f}{\partial x \partial y}$

Solution

$$\frac{\partial f}{\partial x} = \cos y + ye^x$$

$$\frac{\partial f}{\partial y} = -x \sin y + e^x$$

$$\begin{aligned} \frac{\partial^2 f}{\partial x^2} &= \frac{\partial}{\partial x} (\cos y + ye^x) \\ &= ye^x \end{aligned}$$

$$\begin{aligned} \frac{\partial^2 f}{\partial y \partial x} &= \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) \\ &= \frac{\partial}{\partial y} (\cos y + ye^x) \\ &= -\sin y + e^x \end{aligned}$$

$$\begin{aligned} \frac{\partial^2 f}{\partial y^2} &= \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial y} \right) \\ &= \frac{\partial}{\partial y} (-x \sin y + e^x) \\ &= -x \cos y \end{aligned}$$

$$\begin{aligned} \frac{\partial^2 f}{\partial x \partial y} &= \frac{\partial}{\partial x} (-x \sin y + e^x) \\ &= -\sin y + e^x \end{aligned}$$

Theorem – The Mixed Derivative Theorem

If $f(x, y)$ and its partial derivatives f_x, f_y, f_{xy} , and f_{yx} are defined throughout an open region containing a point (a, b) and are all continuous at (a, b) , then

$$f_{xy}(a, b) = f_{yx}(a, b)$$

Example

Find $\frac{\partial^2 w}{\partial x \partial y}$ if $w = xy + \frac{e^y}{y^2 + 1}$

Solution

$$\begin{aligned}\frac{\partial^2 w}{\partial x \partial y} &= \frac{\partial}{\partial x} \left[\frac{\partial}{\partial y} \left(xy + \frac{e^y}{y^2 + 1} \right) \right] \\ &= \frac{\partial}{\partial x} \left(x + \frac{e^y(y^2 + 1) - 2ye^y}{(y^2 + 1)^2} \right) \\ &= 1\end{aligned}$$

Partial Derivatives of Still Higher Order

Example

Find f_{yxyz} if $f(x, y, z) = 1 - 2xy^2z + x^2y$

Solution

$$f_y = -4xyz + x^2$$

$$f_{yx} = -4yz + 2x$$

$$f_{yxy} = -4z$$

$$f_{yxyz} = -4$$

Differentiability

Theorem – The Increment Theorem for Functions of Two Variables

Suppose that the first partial derivatives of $f(x, y)$ are defined throughout an open region R containing a point (x_0, y_0) and that f_x and f_y are continuous at (x_0, y_0) . Then the change

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$$

In the value of f that results from moving from (x_0, y_0) to another point $(x_0 + \Delta x, y_0 + \Delta y)$ in R satisfies an equation of the form

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \varepsilon_1\Delta x + \varepsilon_2\Delta y$$

In which each of $\varepsilon_1, \varepsilon_2 \rightarrow 0$ as both $\Delta x, \Delta y \rightarrow 0$

Definition

A function $z = f(x, y)$ is **differentiable at** (x_0, y_0) if $f_x(x_0, y_0)$ and $f_y(x_0, y_0)$ exist and Δz satisfies an equation of the form

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \varepsilon_1\Delta x + \varepsilon_2\Delta y$$

In which each of $\varepsilon_1, \varepsilon_2 \rightarrow 0$ as both $\Delta x, \Delta y \rightarrow 0$. We call f **differentiable** if it is differentiable at every point in its domain, and say that its graph is a **smooth surface**.

Exercises Section 2.3 – Partial Derivatives

(1 – 17) Find $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$

1. $f(x, y) = 2x^2 - 3y - 4$

2. $f(x, y) = x^2 - xy + y^2$

3. $f(x, y) = 5xy - 7x^2 - y^2 + 3x - 6y + 2$

4. $f(x, y) = (xy - 1)^2$

5. $f(x, y) = \left(x^3 + \frac{y}{2}\right)^{2/3}$

6. $f(x, y) = \frac{1}{x + y}$

7. $f(x, y) = \frac{x}{x^2 + y^2}$

8. $f(x, y) = \tan^{-1} \frac{y}{x}$

9. $f(x, y) = e^{-x} \sin(x + y)$

10. $f(x, y) = e^{xy} \ln y$

11. $f(x, y) = \sin^2(x - 3y)$

12. $f(x, y) = \cos^2(3x - y^2)$

13. $f(x, y) = x^y$

14. $f(x, y) = 3x^2 y^5$

15. $f(x, y) = x \cos y - y \sin x$

16. $f(x, y) = \frac{x^2}{x^2 + y^2}$

17. $f(x, y) = xy e^{xy}$

(18 – 30) Find f_x , f_y , and f_z

18. $f(x, y, z) = 1 + xy^2 - 2z^2$

19. $f(x, y, z) = xy + yz + xz$

20. $f(x, y, z) = x - \sqrt{y^2 + z^2}$

21. $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2}$

22. $f(x, y, z) = \sec^{-1}(x + yz)$

23. $f(x, y, z) = \ln(x + 2y + 3z)$

24. $f(x, y, z) = e^{-(x^2 + y^2 + z^2)}$

25. $f(x, y, z) = \tanh(x + 2y + 3z)$

26. $f(x, y, z) = \sinh(xy - z^2)$

27. $f(x, y, z) = \frac{xyz}{x + y}$

28. $f(x, y, z) = 4xyz^2 - \frac{3x}{y}$

29. $f(x, y, z) = e^{x+2y+3z}$

30. $f(x, y, z) = x^2 \sqrt{y + z}$

(31 – 34) Find partial derivatives of the function with respect to each variable

31. $g(r, \theta) = r \cos \theta + r \sin \theta$

33. $h(x, y, z) = \sin(2\pi x + y - 3z)$

32. $f(x, y) = \frac{1}{2} \ln(x^2 + y^2) + \tan^{-1} \frac{y}{x}$

34. $f(r, l, T, w) = \frac{1}{2rl} \sqrt{\frac{T}{\pi w}}$

(35 – 43) Find all the second-order partial derivatives of

35. $f(x, y) = x + y + xy$

36. $f(x, y) = \sin xy$

37. $g(x, y) = x^2y + \cos y + y \sin x$

38. $r(x, y) = \ln(x + y)$

39. $w = x^2 \tan(xy)$

40. $w = ye^{x^2 - y}$

41. $g(x, y) = y + \frac{x}{y}$

42. $g(x, y) = e^x + y \sin x$

43. $f(x, y) = y^2 - 3xy + \cos y + 7e^y$

(44 – 45) Verify that the function satisfies Laplace's equation $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$

44. $u(x, y) = y(3x^2 - y^2)$

45. $u(x, y) = \ln(x^2 + y^2)$

46. Let $f(x, y) = 2x + 3y - 4$. Find the slope of the line tangent to this surface at the point $(2, -1)$ and lying in the

a) Plane $x = 2$

b) Plane $y = -1$.

47. Let $w = f(x, y, z)$ be a function of three independent variables and write the formal definition of the partial derivative $\frac{\partial f}{\partial y}$ at (x_0, y_0, z_0) . Use this definition to find $\frac{\partial f}{\partial y}$ at $(-1, 0, 3)$ for $f(x, y, z) = -2xy^2 + yz^2$.

48. Find the value of $\frac{\partial x}{\partial z}$ at the point $(1, -1, -3)$ if the equation $xz + y \ln x - x^2 + 4 = 0$ defines x as a function of the two independent variables y and z and the partial derivative exists.

49. Express A implicitly as a function of a , b , and c and calculate $\frac{\partial A}{\partial a}$ and $\frac{\partial A}{\partial b}$.

50. An important partial differential equation that describes the distribution of heat in a region at time t can be represented by the *one-dimensional heat equation*

$$\frac{\partial f}{\partial t} = \frac{\partial^2 f}{\partial x^2}$$

Show that $u(x,t) = \sin(\alpha x) \cdot e^{-\beta t}$ satisfies the heat equation for constants α and β . What is the relationship between α and β for this function to be a solution?

Section 2.4 – Chain Rule

Functions of Two Variables

Theorem – Chain Rule for Functions of Two Independent Variables

If $w = f(x, y)$ is differentiable and if $x = x(t)$, $y = y(t)$ are differentiable functions of t , then the composite $w = f(x(t), y(t))$ is a differentiable function of t and

$$\frac{dw}{dt} = f_x(x(t), y(t)) \cdot x'(t) + f_y(x(t), y(t)) \cdot y'(t)$$

$$\frac{dw}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$$

Chain Rule

Example

Use the Chain Rule to find the derivative of $w = xy$ with respect to t along the path $x = \cos t$, $y = \sin t$.

What is the derivative's value at $t = \frac{\pi}{2}$?

Solution

$$\begin{aligned}
 \frac{dw}{dt} &= \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} \\
 &= \frac{\partial(xy)}{\partial x} \frac{d}{dt}(\cos t) + \frac{\partial(xy)}{\partial y} \frac{d}{dt}(\sin t) \\
 &= y(-\sin t) + x(\cos t) \\
 &= (\sin t)(-\sin t) + (\cos t)(\cos t) \\
 &= -\sin^2 t + \cos^2 t
 \end{aligned}$$

$$= \cos 2t \Big|$$

$$w = xy$$

$$= \cos t \sin t$$

$$= \frac{1}{2} \sin 2t$$

$$\frac{dw}{dt} = \frac{1}{2} (2 \cos 2t)$$

$$= \cos 2t \Big|$$

$$\left. \frac{dw}{dt} \right|_{t=\pi/2} = \cos 2 \left(\frac{\pi}{2} \right)$$

$$= \cos(\pi)$$

$$= -1 \Big|$$

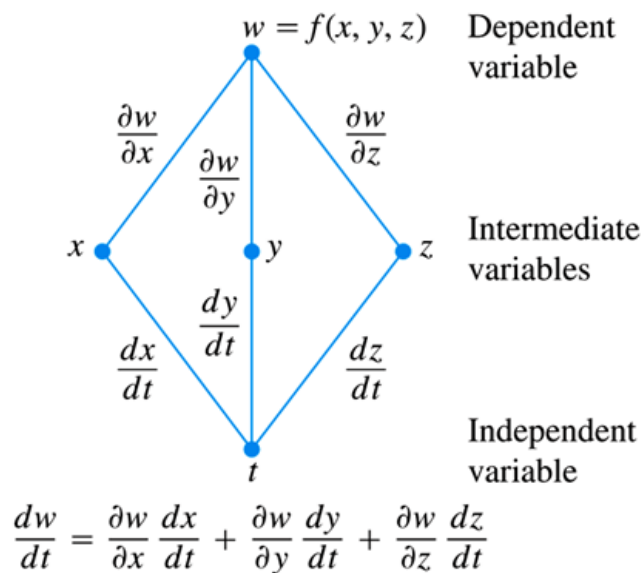

Functions of Three Variables

Theorem – Chain Rule for Functions of Three Independent Variables

If $w = f(x, y, z)$ is differentiable and if x , y , and z are differentiable functions of t , then w is a differentiable function of t and

$$\frac{dw}{dt} = \frac{\partial w}{\partial x} \frac{dx}{dt} + \frac{\partial w}{\partial y} \frac{dy}{dt} + \frac{\partial w}{\partial z} \frac{dz}{dt}$$

Chain Rule

Example

Find $\frac{dw}{dt}$ if $w = xy + z$, $x = \cos t$, $y = \sin t$, $z = t$

In this example the values of $w(t)$ are changing along the path of a helix as t changes. What is the derivative's value at $t = 0$?

Solution

$$\begin{aligned}\frac{dw}{dt} &= \frac{\partial w}{\partial x} \frac{dx}{dt} + \frac{\partial w}{\partial y} \frac{dy}{dt} + \frac{\partial w}{\partial z} \frac{dz}{dt} \\ &= (y)(-\sin t) + (x)(\cos t) + (1)(1) \\ &= (\sin t)(-\sin t) + (\cos t)(\cos t) + 1 \\ &= -\sin^2 t + \cos^2 t + 1 \\ &= \cos 2t + 1\end{aligned}$$

$$\left. \frac{dw}{dt} \right|_{t=0} = \cos(0) + 1 = 2$$

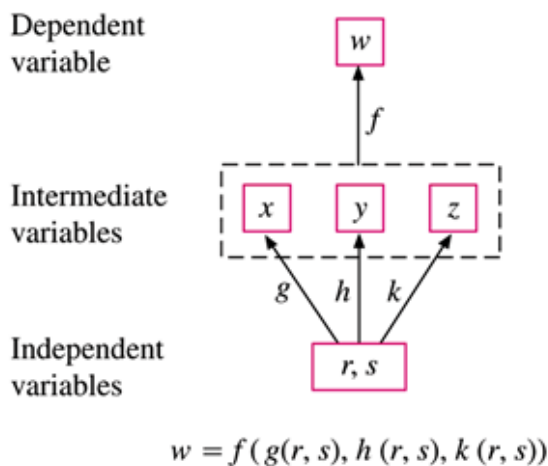

Functions Defined on Surfaces

Theorem – Chain Rule for Two Independent Variables and Three Intermediate Variables

Suppose that $w = f(x, y, z)$, $x = g(r, s)$, $y = h(r, s)$, and $z = k(r, s)$. If all four functions are differentiable, then w has partial derivatives with respect to r and s , given by the formulas

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial r}$$

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial s}$$

Example

Express $\frac{\partial w}{\partial r}$ and $\frac{\partial w}{\partial s}$ in terms of r and s if $w = x + 2y + z^2$, $x = \frac{r}{s}$, $y = r^2 + \ln s$, $z = 2r$

Solution

$$\begin{aligned} \frac{\partial w}{\partial r} &= \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial r} \\ &= (1) \left(\frac{1}{s} \right) + (2) (2r) + (2z) (2) \\ &= \frac{1}{s} + 4r + (4r) (2) \\ &= \frac{1}{s} + 12r \end{aligned}$$

$$\begin{aligned} \frac{\partial w}{\partial s} &= \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial s} \\ &= (1) \left(-\frac{r}{s^2} \right) + (2) \left(\frac{1}{s} \right) + (2z) (0) \\ &= -\frac{r}{s^2} + \frac{2}{s} \end{aligned}$$

➤ If $w = f(x, y)$, $x = g(r, s)$ and $y = h(r, s)$, then

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r} \quad \text{and} \quad \frac{\partial w}{\partial s} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s}$$

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r}$$

Example

Express $\frac{\partial w}{\partial r}$ and $\frac{\partial w}{\partial s}$ in terms of r and s if $w = x^2 + y^2$, $x = r - s$, $y = r + s$

Solution

$$\begin{aligned} \frac{\partial w}{\partial r} &= \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r} \\ &= (2x)(1) + (2y)(1) \\ &= 2(r - s) + 2(r + s) \\ &= 2r - 2s + 2r + 2s \\ &= 4r \end{aligned}$$

$$\begin{aligned} \frac{\partial w}{\partial s} &= \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s} \\ &= (2x)(-1) + (2y)(1) \\ &= -2(r - s) + 2(r + s) \\ &= -2r + 2s + 2r + 2s \\ &= 4s \end{aligned}$$

➤ If $w = f(x)$, $x = g(r, s)$, then

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} \quad \text{and} \quad \frac{\partial w}{\partial s} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial s}$$

$$\frac{\partial w}{\partial r} = \frac{dw}{dx} \frac{\partial x}{\partial r}$$

$$\frac{\partial w}{\partial s} = \frac{dw}{dx} \frac{\partial x}{\partial s}$$

$$\frac{dw}{dx} = F_x \cdot 1 + F_y \cdot \frac{dy}{dx}$$

Implicit Differentiation Revisited

Theorem – A Formula for Implicit Differentiation

Suppose that $F(x, y)$ is differentiable and that the equation $F(x, y) = 0$ defines y as a differentiable function of x . Then at any point where $F_y \neq 0$,

$$\frac{dy}{dx} = -\frac{F_x}{F_y}$$
$$\frac{dz}{dx} = -\frac{F_x}{F_z} \quad \frac{dz}{dy} = -\frac{F_y}{F_z}$$

Example

Find $\frac{dy}{dx}$ if $y^2 - x^2 - \sin xy = 0$

Solution

$$F(x, y) = y^2 - x^2 - \sin xy$$

$$\begin{aligned}\frac{dy}{dx} &= -\frac{F_x}{F_y} \\ &= -\frac{-2x - y \cos xy}{2y - x \cos xy} \\ &= \frac{2x + y \cos xy}{2y - x \cos xy}\end{aligned}$$

Example

Find $\frac{dz}{dx}$ and $\frac{dz}{dy}$ at $(0, 0, 0)$ if $x^3 + z^2 + ye^{xz} + z \cos y = 0$

Solution

$$F(x, y, z) = x^3 + z^2 + ye^{xz} + z \cos y$$

$$F_x = 3x^2 + yze^{xz}, \quad F_y = e^{xz} - z \sin y, \quad \text{and} \quad F_z = 2z + xye^{xz} + \cos y$$

$$F(0, 0, 0) = 0 \quad F_z = 1 \neq 0$$

$$\begin{aligned}\frac{dz}{dx} &= -\frac{F_x}{F_z} \\ &= -\frac{3x^2 + yze^{xz}}{2z + xye^{xz} + \cos y} \Big|_{(0,0,0)}\end{aligned}$$

$$= -\frac{0}{1}$$

$$\underline{= 0}$$

$$\frac{dz}{dy} = -\frac{F_y}{F_z}$$

$$= -\frac{e^{xz} - z \sin y}{2z + xye^{xz} + \cos y} \Big|_{(0,0,0)}$$

$$= -\frac{1}{1}$$

$$\underline{= -1}$$

Exercises Section 2.4 – Chain Rule

(1 – 6) Express $\frac{dw}{dt}$ as a function of t , then evaluate $\frac{dw}{dt}$ at the given value of t .

1. $w = x^2 + y^2$, $x = \cos t$, $y = \sin t$, $t = \pi$
2. $w = x^2 + y^2$, $x = \cos t + \sin t$, $y = \cos t - \sin t$, $t = 0$
3. $w = \ln(x^2 + y^2 + z^2)$, $x = \cos t$, $y = \sin t$, $z = 4\sqrt{t}$, $t = 3$
4. $w = z - \sin xy$, $x = t$, $y = \ln t$, $z = e^{t-1}$, $t = 1$
5. $w = \sin(xy + \pi)$, $x = e^t$, $y = \ln(t + 1)$, $t = 0$
6. $w = xe^y + y \sin z - \cos z$, $x = 2\sqrt{t}$, $y = t - 1 + \ln t$, $z = \pi t$, $t = 1$

7. Express $\frac{\partial z}{\partial u}$ and $\frac{\partial z}{\partial v}$ as functions of u and v if $z = 4e^x \ln y$, $x = \ln(u \cos v)$, $y = u \sin v$, then evaluate $\frac{\partial z}{\partial u}$ and $\frac{\partial z}{\partial v}$ at the point $(u, v) = \left(2, \frac{\pi}{4}\right)$.

8. Express $\frac{\partial w}{\partial u}$ and $\frac{\partial w}{\partial v}$ as functions of u and v if $w = xy + yz + xz$, $x = u + v$, $y = u - v$, $z = uv$, then evaluate $\frac{\partial w}{\partial u}$ and $\frac{\partial w}{\partial v}$ at the point $(u, v) = \left(\frac{1}{2}, 1\right)$.

9. Express $\frac{\partial u}{\partial x}$, $\frac{\partial u}{\partial y}$ and $\frac{\partial u}{\partial z}$ as functions of x , y and z if

$u = e^{qr} \sin^{-1} p$, $p = \sin x$, $q = z^2 \ln y$, $r = \frac{1}{z}$, then evaluate $\frac{\partial u}{\partial x}$, $\frac{\partial u}{\partial y}$ and $\frac{\partial u}{\partial z}$ at the point $(x, y, z) = \left(\frac{\pi}{4}, \frac{1}{2}, -\frac{1}{2}\right)$.

10. Find the values of $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ if $z^3 - xy + yz + y^3 - 2 = 0$ at the point $(1, 1, 1)$

11. Find the values of $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ if $\sin(x + y) + \sin(y + z) + \sin(x + z) = 0$ at the point (π, π, π)

12. Find the values of $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ if $xe^y + ye^z + 2 \ln x - 2 - 3 \ln 2 = 0$ at the point $(1, \ln 2, \ln 3)$

13. Find $\frac{\partial w}{\partial r}$ when $r = 1$, $s = -1$ if $w = (x + y + z)^2$, $x = r - s$, $y = \cos(r + s)$, $z = \sin(r + s)$

14. Find $\frac{\partial z}{\partial u}$ when $u = 0$, $v = 1$ if $z = \sin xy + x \sin y$, $x = u^2 + v^2$, $y = uv$

15. Find $\frac{\partial z}{\partial u}$ and $\frac{\partial z}{\partial v}$ when $u = \ln 2$, $v = 1$ if $z = 5 \tan^{-1} x$, $x = e^u + \ln v$

16. Find $\frac{\partial z}{\partial u}$ and $\frac{\partial z}{\partial v}$ when $u = 1$, $v = -2$ if $z = \ln q$, $q = \sqrt{v+3} \tan^{-1} u$
17. Find $\frac{\partial w}{\partial r}$ and $\frac{\partial w}{\partial s}$ when $r = \pi$ and $s = 0$ if $w = \sin(2x - y)$, $x = r + \sin s$, $y = rs$
18. Assume that $w = f(s^3 + t^2)$ and $f'(x) = e^x$. Find $\frac{\partial w}{\partial t}$ and $\frac{\partial w}{\partial s}$

(19 – 22) Evaluate the derivatives

19. $w'(t)$, where $w = xyz \sin z$, $x = t^2$, $y = 4t^3$, and $z = t + 1$
20. $w'(t)$, where $w = \sqrt{x^2 + y^2 + z^2}$, $x = \sin t$, $y = \cos t$, and $z = \cos t$
21. w_s and w_t , where $w = xyz$, $x = 2st$, $y = st^2$, and $z = s^2t$
22. w_r , w_s , and w_t , where $w = \ln(xy^2)$, $x = rst$, and $y = r + s$

23. The voltage V in a circuit that satisfies the law $V = IR$ is slowly dropping as the battery wears out. At the same time, the resistance R is increasing as the resistor heats up. Use the equation

$$\frac{dV}{dt} = \frac{\partial V}{\partial I} \frac{dI}{dt} + \frac{\partial V}{\partial R} \frac{dR}{dt}$$

To find how the current is changing at the instant when $R = 600 \Omega$, $I = 0.04 A$,

$$\frac{dR}{dt} = 0.5 \text{ ohm / sec}, \text{ and } \frac{dV}{dt} = -0.01 \text{ volt / sec}$$

24. The lengths a , b , and c of the edges of a rectangular box are changing with time. At the instant in question, $a = 1 \text{ m}$, $b = 2 \text{ m}$, $c = 3 \text{ m}$, $\frac{da}{dt} = \frac{db}{dt} = 1 \text{ m / sec}$, and $\frac{dc}{dt} = -3 \text{ m / sec}$. At what rates the box's volume V and surface area S changing at that instant? Are the box's interior diagonals increasing in length or decreasing?
25. Let $T = f(x, y)$ be the temperature at the point (x, y) on the circle $x = \cos t$, $y = \sin t$, $0 \leq t \leq 2\pi$ and suppose that

$$\frac{\partial T}{\partial x} = 8x - 4y, \quad \frac{\partial T}{\partial y} = 8y - 4x$$

- a) Find where the maximum and minimum temperatures on the circle occur by examining the derivatives $\frac{dT}{dt}$ and $\frac{d^2T}{dt^2}$.

b) Suppose that $T = 4x^2 - 4xy + 4y^2$. Find the maximum and minimum values of T on the circle.

(26 – 33) Evaluate $\frac{dy}{dx}$

26. $x^2 - 2y^2 - 1 = 0$

29. $ye^{xy} - 2 = 0$

32. $y \ln(x^2 + y^2) = 4$

27. $x^3 + 3xy^2 - y^5 = 0$

30. $\sqrt{x^2 + 2xy + y^4} = 3$

33. $2x^2 + 3xy - 3y^4 = 2$

28. $2 \sin xy = 1$

31. $y \ln(x^2 + y^2 + 4) = 3$

(34 – 37) Find $\frac{dz}{dx}$ and $\frac{dz}{dy}$ at the given point.

34. $z^3 - xy + yz + y^3 - 2 = 0$; $(1, 1, 1)$

35. $\frac{1}{x} + \frac{1}{y} + \frac{1}{z} - 1 = 0$; $(2, 3, 6)$

36. $\sin(x + y) + \sin(y + z) + \sin(x + z) = 0$; (π, π, π)

37. $xe^y + ye^z + 2 \ln x - 2 - 3 \ln 2 = 0$; $(1, \ln 2, \ln 3)$

38. Consider the surface and parameterized curves C in the xy -plane

$$z = 4x^2 + y^2 - 2; \quad C: x = \cos t, \quad y = \sin t, \quad \text{for } 0 \leq t \leq 2\pi$$

a) Find $z'(t)$ on C .

b) Imagine that you are walking on the surface directly above C consistent with the positive orientation of C . Find the values of t for which you are walking uphill.

39. Consider the surface and parameterized curves C in the xy -plane

$$z = 4x^2 - 2y^2 + 4; \quad C: x = 2 \cos t, \quad y = 2 \sin t, \quad \text{for } 0 \leq t \leq 2\pi$$

a) Find $z'(t)$ on C .

b) Imagine that you are walking on the surface directly above C consistent with the positive orientation of C . Find the values of t for which you are walking uphill.

40. Find the value of the derivative of $f(x, y, z) = xy + yz + xz$ with respect to t on the curve

$$x = \cos t, \quad y = \sin t, \quad z = \cos 2t \quad \text{at } t = 1$$

41. Define y as a differentiable function of x for $2xy + e^{x+y} - 2 = 0$, find the values of $\frac{dy}{dx}$ at point

$$P(0, \ln 2)$$

Section 2.5 – Directional Derivatives and the Gradient

You notice that the streams flow perpendicular to the contours. The streams are following paths of steepest descent so the waters reach lower elevation as quickly as possible. Therefore, the fastest instantaneous rate of change in a stream's elevation above the sea level has a particular direction.

Directional Derivatives in the Plane

The rate at which f changes with respect to t along a differentiable curve $x = g(t)$, $y = h(t)$ is

$$\frac{df}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$$

Suppose that the function $f(x, y)$ is defined throughout a region R in the xy -plane, that $P_0(x_0, y_0)$ is a point in R , and that $\vec{u} = u_1\hat{i} + u_2\hat{j}$ is a unit vector. Then the equations

$$x = x_0 + su_1, \quad y = y_0 + su_2$$

Definition

The derivative of f at $P_0(x_0, y_0)$ in the direction of the unit vector $\vec{u} = u_1\hat{i} + u_2\hat{j}$ is the number

$$\left(\frac{df}{ds}\right)_{\vec{u}, P_0} = \lim_{s \rightarrow 0} \frac{f(x_0 + su_1, y_0 + su_2) - f(x_0, y_0)}{s}$$

provided the limit exists.

The directional derivative is also noted by: $(D_{\vec{u}} f)_{P_0}$

Example

Find the derivative of $f(x, y) = x^2 + xy$ at $P_0(1, 2)$ in the direction of the unit vector $\vec{u} = \frac{1}{\sqrt{2}}\hat{i} + \frac{1}{\sqrt{2}}\hat{j}$

Solution

$$\begin{aligned} \left(\frac{df}{ds}\right)_{\vec{u}, P_0} &= \lim_{s \rightarrow 0} \frac{f(x_0 + su_1, y_0 + su_2) - f(x_0, y_0)}{s} \\ &= \lim_{s \rightarrow 0} \frac{f\left(1 + s\frac{1}{\sqrt{2}}, 2 + s\frac{1}{\sqrt{2}}\right) - f(1, 2)}{s} \\ &= \lim_{s \rightarrow 0} \frac{\left(1 + \frac{s}{\sqrt{2}}\right)^2 + \left(1 + \frac{s}{\sqrt{2}}\right)\left(2 + \frac{s}{\sqrt{2}}\right) - (1^2 + 1 \cdot 2)}{s} \\ &= \lim_{s \rightarrow 0} \frac{1 + \frac{2}{\sqrt{2}}s + \frac{1}{2}s^2 + 2 + \frac{3}{\sqrt{2}}s + \frac{1}{2}s^2 - 3}{s} \\ &= \lim_{s \rightarrow 0} \frac{s^2 + \frac{5}{\sqrt{2}}s}{s} \\ &= \lim_{s \rightarrow 0} \left(s + \frac{5}{\sqrt{2}}\right) \\ &= \frac{5}{\sqrt{2}} \end{aligned}$$

The rate of change of $f(x, y) = x^2 + xy$ at $P_0(1, 2)$ in the direction \vec{u} is $\frac{5}{\sqrt{2}}$

Interpretation of the Directional Derivative

The equation $z = f(x, y)$ represents a surface S in space. If $z_0 = f(x_0, y_0)$, then the point $P_0(x_0, y_0, z_0)$ lies on S . The vertical plane that passes through P and $P_0(x_0, y_0, z_0)$ parallel to \vec{u} intersects S in a curve C .

When $\vec{u} = \hat{i}$, the directional derivative at P_0 is $\frac{\partial f}{\partial x}$ evaluated at (x_0, y_0) .

When $\vec{u} = \hat{j}$, the directional derivative at P_0 is $\frac{\partial f}{\partial y}$ evaluated at (x_0, y_0) .

The directional derivative generalizes the two partial derivatives.

Calculation and Gradients

$$\begin{aligned}
 \left(\frac{df}{ds} \right) \Big|_{\vec{u}, P_0} &= \left(\frac{\partial f}{\partial x} \right)_{P_0} \frac{dx}{ds} + \left(\frac{\partial f}{\partial y} \right)_{P_0} \frac{dy}{ds} \\
 &= \left(\frac{\partial f}{\partial x} \right)_{P_0} u_1 + \left(\frac{\partial f}{\partial y} \right)_{P_0} u_2 \\
 &= \underbrace{\left[\left(\frac{\partial f}{\partial x} \right)_{P_0} \hat{i} + \left(\frac{\partial f}{\partial y} \right)_{P_0} \hat{j} \right]}_{\text{Gradient of } f \text{ at } P_0} \cdot \underbrace{(u_1 \hat{i} + u_2 \hat{j})}_{\text{Directional } u}
 \end{aligned}$$

Definition

Gradient is an increase/decrease in the magnitude (change in the value) of an object such temperature or pressure with change in position in a given variable to another.

The **gradient vector** (gradient) of $f(x, y)$ at a point $P_0(x_0, y_0)$ is the vector

$$\nabla f = \frac{\partial f}{\partial x} \hat{i} + \frac{\partial f}{\partial y} \hat{j}$$

obtained by evaluating the partial derivatives of f at P_0

$\therefore \nabla$ pronounces “*del*”

Theorem – The directional Derivative is a Dot Product

If $f(x, y)$ is differentiable in an open region containing $P_0(x_0, y_0)$, then

$$\left(\frac{df}{ds} \right)_{\vec{u}, P_0} = (\nabla f)_{P_0} \cdot \vec{u}$$

The dot product of the gradient ∇f at P_0 and \vec{u} .

Example

Find the derivative of $f(x, y) = xe^y + \cos(xy)$ at the point $(2, 0)$ in the direction of $\vec{v} = 3\hat{i} - 4\hat{j}$

Solution

$$\begin{aligned} \vec{u} &= \frac{\vec{v}}{|\vec{v}|} = \frac{3\hat{i} - 4\hat{j}}{\sqrt{3^2 + 4^2}} \\ &= \frac{3}{5}\hat{i} - \frac{4}{5}\hat{j} \end{aligned}$$

The partial derivatives of f are continuous and at $(2, 0)$

$$\begin{aligned} f_x(2, 0) &= \left(e^y - y \sin(xy) \right)_{(2,0)} \\ &= e^0 - 0 = 1 \\ &= \underline{1} \\ f_y(2, 0) &= \left(xe^y - x \sin(xy) \right)_{(2,0)} \\ &= 2e^0 - 0 \\ &= \underline{2} \end{aligned}$$

$$\begin{aligned}\nabla f &= f_x(2,0)\hat{i} + f_y(2,0)\hat{j} \\ &= \hat{i} + 2\hat{j}\end{aligned}$$

Therefore; the derivative of f at $(2, 0)$ in the direction of \vec{v} is

$$\begin{aligned}\left(D_{\vec{u}}f\right)\Big|_{(2,0)} &= (\nabla f)_{(2,0)} \cdot \vec{u} \\ &= (\hat{i} + 2\hat{j}) \cdot \left(\frac{3}{5}\hat{i} - \frac{4}{5}\hat{j}\right) \\ &= \frac{3}{5} - \frac{8}{5} \\ &= \underline{-1}\end{aligned}$$

Properties of the Directional Derivative $D_{\vec{u}}f = \nabla f \cdot \vec{u} = |\nabla f| \cos \theta$

1. The function f increases most rapidly when $\cos \theta = 1$ or when $\theta = 0$ and \vec{u} is the direction of ∇f . That is, at each point P in its domain, f increases most rapidly in the direction of the gradient vector ∇f at P . The derivative in this direction is $D_{\vec{u}}f = |\nabla f| \cos 0 = |\nabla f|$
2. Similarly, f decreases most rapidly in the direction of $-\nabla f$. The derivative in this direction is $D_{\vec{u}}f = |\nabla f| \cos(\pi) = -|\nabla f|$
3. Any direction \vec{u} orthogonal to a gradient ∇f is a direction of zero change in f because θ then equals $\frac{\pi}{2}$ and $D_{\vec{u}}f = |\nabla f| \cos\left(\frac{\pi}{2}\right) = |\nabla f| \cdot (0) = 0$

Example

Find the directions in which $f(x, y) = \frac{x^2}{2} + \frac{y^2}{2}$

- Increases most rapidly at the point (1, 1)
- decreases most rapidly at the point (1, 1)
- What are the directions of zero change in f at (1, 1)

Solution

- The function increases most rapidly at the point (1, 1).

The gradient is

$$\begin{aligned}\nabla f &= f_x \hat{i} + f_y \hat{j} \\ &= x\hat{i} + y\hat{j} \\ (\nabla f)_{(1,1)} &= (x\hat{i} + y\hat{j})_{(1,1)} \\ &= \hat{i} + \hat{j}\end{aligned}$$

Its direction is:

$$\begin{aligned}\vec{u} &= \frac{\hat{i} + \hat{j}}{|\hat{i} + \hat{j}|} \\ &= \frac{1}{\sqrt{2}}\hat{i} + \frac{1}{\sqrt{2}}\hat{j}\end{aligned}$$

- The function decreases most rapidly at the point (1, 1).

$$\text{The gradient is } -(\nabla f)_{(1,1)} = -\hat{i} - \hat{j}$$

$$\text{Its direction is: } -\vec{u} = -\frac{1}{\sqrt{2}}\hat{i} - \frac{1}{\sqrt{2}}\hat{j}$$

- The directions of zero change at (1, 1) are the direction orthogonal to ∇f :

$$\vec{n} = -\frac{1}{\sqrt{2}}\hat{i} + \frac{1}{\sqrt{2}}\hat{j} \quad \text{and} \quad -\vec{n} = \frac{1}{\sqrt{2}}\hat{i} - \frac{1}{\sqrt{2}}\hat{j}$$

Gradients and Tangents to Level Curves

If a differentiable function $f(x, y)$ has a constant value c along a smooth curve $r = g(t)\hat{i} + h(t)\hat{j}$, then $f(g(t), h(t)) = c$. Differentiating both sides of this equation with respect to t leads to the equations

$$\frac{d}{dt} f(g(t), h(t)) = \frac{d}{dt}(c)$$

$$\frac{\partial f}{\partial x} \frac{dg}{dt} + \frac{\partial f}{\partial y} \frac{dh}{dt} = 0$$

$$\underbrace{\left(\frac{\partial f}{\partial x} \hat{i} + \frac{\partial f}{\partial y} \hat{j} \right)}_{\nabla f} \cdot \underbrace{\left(\frac{dg}{dt} \hat{i} + \frac{dh}{dt} \hat{j} \right)}_{\frac{dr}{dt}} = 0$$

- At every point (x_0, y_0) in the domain of a differentiable function $f(x, y)$, the gradient of f is normal to the level curve through (x_0, y_0) .

Example

Find an equation for the tangent to the ellipse $\frac{x^2}{4} + y^2 = 2$ at the point $(-2, 1)$

Solution

$$f(x, y) = \frac{x^2}{4} + y^2$$

The gradient of f at $(-2, 1)$ is

$$\nabla f = f_x \hat{i} + f_y \hat{j}$$

$$= \frac{x}{2} \hat{i} + 2y \hat{j}$$

$$\begin{aligned} \nabla f \Big|_{(-2, 1)} &= \left(\frac{x}{2} \hat{i} + 2y \hat{j} \right)_{(-2, 1)} \\ &= -\hat{i} + 2\hat{j} \end{aligned}$$

The equation of the line is given by:

$$f_x (x - x_0) + f_y (y - y_0) = 0$$

$$(-1)(x - (-2)) + (2)(y - 1) = 0$$

$$-x - 2 + 2y - 2 = 0$$

$$-x + 2y = 4$$

$$\underline{x - 2y = -4}$$

Algebra Rules for Gradients

Sum Rule: $\nabla(f + g) = \nabla f + \nabla g$

Difference Rule: $\nabla(f - g) = \nabla f - \nabla g$

Constant Multiple Rule: $\nabla(kf) = k\nabla f \quad \forall k$

Product Rule: $\nabla(fg) = f\nabla g + g\nabla f$

Quotient Rule: $\nabla\left(\frac{f}{g}\right) = \frac{g\nabla f - f\nabla g}{g^2}$

Functions of Three Variables

For a differentiable function $f(x, y, z)$ and a unit $\vec{u} = u_1\hat{i} + u_2\hat{j} + u_3\hat{k}$ in space, we have

$$\nabla f = \frac{\partial f}{\partial x}\hat{i} + \frac{\partial f}{\partial y}\hat{j} + \frac{\partial f}{\partial z}\hat{k}$$

$$D_{\vec{u}}f = \nabla f \cdot \vec{u}$$

$$= \frac{\partial f}{\partial x}u_1 + \frac{\partial f}{\partial y}u_2 + \frac{\partial f}{\partial z}u_3$$

The directional derivative can be written in the form

$$\begin{aligned} D_{\vec{u}}f &= \nabla f \cdot \vec{u} \\ &= |\nabla f| |\vec{u}| \cos \theta \\ &= |\nabla f| \cos \theta \end{aligned}$$

Example

- a) Find the derivative of $f(x, y, z) = x^3 - xy^2 - z$ at $P_0(1, 1, 0)$ in the direction of $\vec{v} = 2\hat{i} - 3\hat{j} + 6\hat{k}$
- b) In what directions does f change most rapidly at P_0 , and what are the rates of change in these directions?

Solution

- a) The direction of \vec{v} is obtained by dividing \vec{v} by its length:

$$\begin{aligned} |\vec{v}| &= \sqrt{2^2 + (-3)^2 + 6^2} \\ &= 7 \end{aligned}$$

$$\vec{u} = \frac{\vec{v}}{|\vec{v}|} = \frac{2}{7}\hat{i} - \frac{3}{7}\hat{j} + \frac{6}{7}\hat{k}$$

The partial derivatives of f at P_0 are

$$f_x \Big|_{(1,1,0)} = \left(3x^2 - y^2 \right) \Big|_{(1,1,0)} = 2$$

$$f_y \Big|_{(1,1,0)} = -2y \Big|_{(1,1,0)} = -2$$

$$f_z \Big|_{(1,1,0)} = -1$$

The gradient of f at P_0 is

$$\begin{aligned} \nabla f \Big|_{(1,1,0)} &= \left(\frac{\partial f}{\partial x} \hat{i} + \frac{\partial f}{\partial y} \hat{j} + \frac{\partial f}{\partial z} \hat{k} \right) \Big|_{(1,1,0)} \\ &= 2\hat{i} - 2\hat{j} - \hat{k} \end{aligned}$$

Therefore, the derivative of f at P_0 in the direction of \mathbf{v} is

$$\begin{aligned} D_{\vec{u}} f \Big|_{(1,1,0)} &= \nabla f \Big|_{(1,1,0)} \cdot \vec{u} \\ &= (2\hat{i} - 2\hat{j} - \hat{k}) \cdot \left(\frac{2}{7}\hat{i} - \frac{3}{7}\hat{j} + \frac{6}{7}\hat{k} \right) \\ &= (2)\left(\frac{2}{7}\right) + (-2)\left(-\frac{3}{7}\right) + (-1)\left(\frac{6}{7}\right) \\ &= \frac{4}{7} \end{aligned}$$

- b)** The function increases most rapidly in the direction of $\nabla f = 2\hat{i} - 2\hat{j} - \hat{k}$ and decreases most rapidly in the direction of $-\nabla f$.

The rates of change in the directions are

$$|\nabla f| = \sqrt{4 + 4 + 1} = 3 \quad \text{and} \quad -|\nabla f| = -3$$

Exercises Section 2.5 – Directional Derivatives and the Gradient

(1 – 3) Find the gradient of the function at the given point. Then sketch the gradient together with the level curve that passes through the point

1. $f(x, y) = y - x, \quad (2, 1)$

2. $f(x, y) = \ln(x^2 + y^2), \quad (1, 1)$

3. $f(x, y) = \sqrt{2x + 3y}, \quad (-1, 2)$

(4 – 6) Find ∇f at the given point

4. $f(x, y, z) = x^2 + y^2 - 2z^2 + z \ln x, \quad (1, 1, 1)$

5. $f(x, y, z) = 2x^3 - 3(x^2 + y^2)z + \tan^{-1} xz, \quad (1, 1, 1)$

6. $f(x, y, z) = e^{x+y} \cos z + (y+1) \sin^{-1} x, \quad (0, 0, \frac{\pi}{6})$

7. Find the derivative of the function $f(x, y) = 2xy - 3y^2$ at $P_0(5, 5)$ in the direction of $\vec{v} = 4\hat{i} + 3\hat{j}$

8. Find the derivative of the function $f(x, y) = \frac{x-y}{xy+2}$ at $P_0(1, -1)$ in the direction of $\vec{v} = 12\hat{i} + 5\hat{j}$

9. Find the derivative of the function $h(x, y) = \tan^{-1}\left(\frac{y}{x}\right) + \sqrt{3} \sin^{-1}\left(\frac{xy}{2}\right)$ at $P_0(1, 1)$ in the direction of $\vec{v} = 3\hat{i} - 2\hat{j}$

10. Find the derivative of the function $f(x, y, z) = xy + yz + zx$ at $P_0(1, -1, 2)$ in the direction of $\vec{v} = 3\hat{i} + 6\hat{j} - 2\hat{k}$

11. Find the derivative of the function $g(x, y, z) = 3e^x \cos yz$ at $P_0(0, 0, 0)$ in the direction of $\vec{v} = 2\hat{i} + \hat{j} - 2\hat{k}$

12. Find the derivative of the function $h(x, y, z) = \cos xy + e^{yz} + \ln zx$ at $P_0\left(1, 0, \frac{1}{2}\right)$ in the direction of $\vec{v} = \hat{i} + 2\hat{j} + 2\hat{k}$

13. Find the directions in which the function $f(x, y) = x^2 + xy + y^2$ increase and decrease most rapidly at $P_0(-1, 1)$. Then find the derivatives of the function in these directions.

14. Find the directions in which the function $f(x, y) = x^2y + e^{xy} \sin y$ increase and decrease most rapidly at $P_0(1, 0)$. Then find the derivatives of the function in these directions.

15. Find the directions in which the function $g(x, y, z) = xe^y + z^2$ increase and decrease most rapidly at $P_0\left(1, \ln 2, \frac{1}{2}\right)$. Then find the derivatives of the function in these directions.
16. Find the directions in which the function $h(x, y, z) = \ln(x^2 + y^2 - 1) + y + 6z$ increase and decrease most rapidly at $P_0(1, 1, 0)$. Then find the derivatives of the function in these directions.
17. Sketch the curve $x^2 + y^2 = 4$; $(f(x, y) = c)$ together with ∇f and the tangent line at the point $(\sqrt{2}, \sqrt{2})$. Then write an equation for the tangent line.
18. Sketch the curve $x^2 - y = 1$; $(f(x, y) = c)$ together with ∇f and the tangent line at the point $(\sqrt{2}, 1)$. Then write an equation for the tangent line.
19. Sketch the curve $x^2 - xy + y^2 = 7$; $(f(x, y) = c)$ together with ∇f and the tangent line at the point $(-1, 2)$. Then write an equation for the tangent line.
20. In what direction is the derivative of $f(x, y) = xy + y^2$ at $P(3, 2)$ equal to zero?
- (21 – 26) Compute the gradient of the function, evaluate it at the given point P , and evaluate the directional derivative at that point in the given direction
21. $f(x, y) = x^2$; $P = (1, 2)$; $\vec{u} = \left\langle \frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}} \right\rangle$
22. $f(x, y) = x^2 y^3$; $P = (-1, 1)$; $\vec{u} = \left\langle \frac{5}{13}, \frac{12}{13} \right\rangle$
23. $f(x, y) = \frac{x}{y^2}$; $P = (0, 3)$; $\vec{u} = \left\langle \frac{\sqrt{3}}{2}, \frac{1}{2} \right\rangle$
24. $f(x, y) = \sqrt{2 + x^2 + 2y^2}$; $P = (2, 1)$; $\vec{u} = \left\langle \frac{3}{5}, \frac{4}{5} \right\rangle$
25. $f(x, y, z) = xy + yz + xz + 4$; $P = (2, -2, 1)$; $\vec{u} = \left\langle 0, -\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}} \right\rangle$
26. $f(x, y, z) = 1 + \sin(x + 2y - z)$; $P = \left(\frac{\pi}{6}, \frac{\pi}{6}, -\frac{\pi}{6}\right)$; $\vec{u} = \left\langle \frac{1}{3}, \frac{2}{3}, \frac{2}{3} \right\rangle$
- (27 – 30) Find the direction in which f increases and decreases most rapidly at P_0 and find the derivative of f in each direction. Also, find the derivative of f at P_0 in the direction of the vector \mathbf{v} .
27. $f(x, y) = \cos x \cos y$, $P_0\left(\frac{\pi}{4}, \frac{\pi}{4}\right)$, $\vec{v} = 3\hat{i} + 4\hat{j}$

28. $f(x, y) = x^2 e^{-2y}$, $P_0(1, 0)$, $\vec{v} = \hat{i} + \hat{j}$

29. $f(x, y, z) = \ln(2x + 3y + 6z)$, $P_0(-1, -1, 1)$, $\vec{v} = 2\hat{i} + 3\hat{j} + 6\hat{k}$

30. $f(x, y, z) = x^2 + 3xy - z^2 + 2y + z + 4$, $P_0(0, 0, 0)$, $\vec{v} = \hat{i} + \hat{j} + \hat{k}$

31. Let $f(x, y) = \ln(1 + xy)$; $P = (2, 3)$

- a) Find the unit vectors that give the direction of steepest ascent and steepest descent at P .
- b) Find a unit vector that points in a direction of no change.

32. Let $f(x, y) = \sqrt{4 - x^2 - y^2}$; $P = (-1, 1)$

- a) Find the unit vectors that give the direction of steepest ascent and steepest descent at P .
- b) Find a unit vector that points in a direction of no change.

(33 – 34) Let $f(x, y) = 8 - 2x^2 - y^2$, for the level curves $f(x, y) = C$ and points (a, b) , compute the slope of the line tangent to the level curve at (a, b) and verify that the tangent line is orthogonal to the gradient at that point.

33. $f(x, y) = 5$; $(a, b) = (1, 1)$

34. $f(x, y) = 0$; $(a, b) = (2, 0)$

35. Find the direction in which the function $f(x, y) = 4x^2 - y^2$ has zero change at the point $(1, 1, 3)$. Express the directions in terms of unit vectors.

36. An infinitely long charged cylinder of radius R with its axis along z -axis has an electric potential $V = k \ln\left(\frac{R}{r}\right)$, where r is the distance between a variable point $P(x, y)$ and the axis of the cylinder $(r^2 = x^2 + y^2)$ and k is a physical constant. The electric field at a point (x, y) in the xy -plane is given by $\vec{E} = -\nabla V$, where ∇V is the two-dimensional gradient. Compute the electric field at a point (x, y) with $r > R$.

Section 2.6 – Tangent Planes and Linear Approximation

Tangent Planes and Normal Lines

If $\vec{r}(t) = g(t)\hat{i} + h(t)\hat{j} + k(t)\hat{k}$ is a smooth curve on the level surface $f(x, y, z) = c$ of a differentiable function f , then $f(g(t), h(t), k(t)) = c$.

Differentiating both sides of this equation with respect to t leads to

$$\frac{d}{dt} f(g(t), h(t), k(t)) = \frac{d}{dt}(c)$$

$$\frac{\partial f}{\partial x} \frac{dg}{dt} + \frac{\partial f}{\partial y} \frac{dh}{dt} + \frac{\partial f}{\partial z} \frac{dk}{dt} = 0$$

$$\underbrace{\left(\frac{\partial f}{\partial x} \hat{i} + \frac{\partial f}{\partial y} \hat{j} + \frac{\partial f}{\partial z} \hat{k} \right)}_{\nabla f} \cdot \underbrace{\left(\frac{dg}{dt} \hat{i} + \frac{dh}{dt} \hat{j} + \frac{dk}{dt} \hat{k} \right)}_{\frac{d\vec{r}}{dt}} = 0$$

Definition

The **tangent plane** at the point $P_0(x_0, y_0, z_0)$ on the level surface $f(x, y, z) = c$ of a differentiable function f is the plane through P_0 normal to $\nabla f|_{P_0}$.

The **normal line** of the surface at P_0 is the line through P_0 parallel to $\nabla f|_{P_0}$.

Normal Line to $f(x, y, z) = c$ at $P_0(x_0, y_0, z_0)$

$$x = x_0 + f_x(P_0)t, \quad y = y_0 + f_y(P_0)t, \quad z = z_0 + f_z(P_0)t$$

Tangent Plane to $f(x, y, z) = c$ at $P_0(x_0, y_0, z_0)$

$$f_x(P_0)(x - x_0) + f_y(P_0)(y - y_0) + f_z(P_0)(z - z_0) = 0$$

Example

Find the tangent plane and normal line of the surface $f(x, y, z) = x^2 + y^2 + z - 9 = 0$ at the point $P_0(1, 2, 4)$

Solution

The tangent plane is the plane through P_0 perpendicular to the gradient of f at P_0 .

The gradient is:

$$\begin{aligned}\nabla f \Big|_{P_0} &= (2x\hat{i} + 2y\hat{j} + \hat{k}) \Big|_{(1, 2, 4)} \\ &= 2\hat{i} + 4\hat{j} + \hat{k}\end{aligned}$$

The tangent plane is the plane

$$2(x-1) + 4(y-2) + (z-4) = 0$$

$$\underline{2x + 4y + z = 14}$$

The line normal to the surface at P_0 is

$$x = 1 + 2t, \quad y = 2 + 4t, \quad z = 4 + t$$

Plane Tangent to a Surface $z = f(x, y)$ at $(x_0, y_0, f(x_0, y_0))$

The plane tangent to the surface $z = f(x, y)$ of a differentiable function f at the point

$P_0(x_0, y_0, z_0) = (x_0, y_0, f(x_0, y_0))$ is

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) - (z - z_0) = 0$$

Example

Find the plane tangent and the normal line to the surface $z = x \cos y - ye^x$ at $(0, 0, 0)$

Solution

$$f(x, y, z) = x \cos y - ye^x - z$$

$$\nabla f = (\cos y - ye^x)\hat{i} + (-x \sin y - e^x)\hat{j} - \hat{k} \Big|_{(0, 0)}$$
$$= \hat{i} - \hat{j} - \hat{k}$$

Therefore, the tangent plane is

$$1(x - 0) - (y - 0) - (z - 0) = 0$$

$$x - y - z = 0$$

The normal line:

$$\begin{cases} x = t \\ y = -t \\ z = -t \end{cases}$$

Example

The surfaces $f(x, y, z) = x^2 + y^2 - 2 = 0$ and $g(x, y, z) = x + z - 4 = 0$ meet in an ellipse E . Find the parametric equations for the line tangent to E at the point $P_0(1, 1, 3)$

Solution

The tangent line is orthogonal to both ∇f and ∇g at P_0 and therefore parallel to $\mathbf{v} = \nabla f \times \nabla g$.

The components of \mathbf{v} and the coordinates of P_0 give us equations for the line.

$$\begin{aligned}\nabla f \Big|_{(1, 1, 3)} &= (2x\hat{i} + 2y\hat{j}) \Big|_{(1, 1, 3)} \\ &= \underline{2\hat{i} + 2\hat{j}}\end{aligned}$$

$$\begin{aligned}\nabla g \Big|_{(1, 1, 3)} &= (\hat{i} + \hat{k}) \Big|_{(1, 1, 3)} \\ &= \underline{\hat{i} + \hat{k}}\end{aligned}$$

$$\vec{v} = (2\hat{i} + 2\hat{j}) \times (\hat{i} + \hat{k})$$

$$\begin{aligned}&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 2 & 0 \\ 1 & 0 & 1 \end{vmatrix} \\ &= \underline{2\hat{i} - 2\hat{j} - 2\hat{k}}\end{aligned}$$

The tangent line is

$$x = 1 + 2t, \quad y = 1 - 2t, \quad z = 3 - 2t$$

Estimating Change in a Specific Direction

How much the value of a function f changes if we move a small distance ds from a point P_0 to another point nearby.

$$df = f'(P_0)ds \quad (\text{single variable})$$

$$df = \left(\nabla f \Big|_{P_0} \cdot \vec{u} \right) ds \quad (\text{two or more variables})$$

\vec{u} is the direction of the motion away from P_0 .

Estimating the Change in f in a Direction \vec{u}

To estimate the change in the value of a differentiable function f when we move a small distance ds from a point P_0 in a particular direction \vec{u} is given by

$$df = \underbrace{\left(\nabla f \Big|_{P_0} \cdot \vec{u} \right)}_{\text{Directional derivative}} \cdot \underbrace{ds}_{\text{Distance}}$$

Example

Estimate how much the value of $f(x, y, z) = y \sin x + 2yz$ will change if the point $P(x, y, z)$ moves 0.1 unit from $P_0(0, 1, 0)$ straight toward $P_1(2, 2, -2)$

Solution

$$\overrightarrow{P_0 P_1} = 2\hat{i} + \hat{j} - 2\hat{k}$$

The direction of the vector is:

$$\begin{aligned} \vec{u} &= \frac{\overrightarrow{P_0 P_1}}{|\overrightarrow{P_0 P_1}|} \\ &= \frac{2\hat{i} + \hat{j} - 2\hat{k}}{\sqrt{4+1+4}} \\ &= \frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} - \frac{2}{3}\hat{k} \end{aligned}$$

$$\begin{aligned} \nabla f \Big|_{(0,1,0)} &= \left((y \cos x)\hat{i} + (\sin x + 2z)\hat{j} + 2y\hat{k} \right) \Big|_{(0,1,0)} \\ &= \hat{i} + 2\hat{k} \end{aligned}$$

$$\begin{aligned}\nabla f \Big|_{P_0} \cdot \vec{u} &= (\hat{i} + 2\hat{k}) \cdot \left(\frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} - \frac{2}{3}\hat{k} \right) \\ &= \frac{2}{3} - \frac{4}{3} \\ &= -\frac{2}{3}\end{aligned}$$

The change df in f that results from moving $ds = 0.1$ unit away from P_0 in the direction of \vec{u} is

$$\begin{aligned}df &= \left(\nabla f \Big|_{P_0} \cdot \vec{u} \right) (ds) \\ &= \left(-\frac{2}{3} \right) (0.1) \\ &\approx -0.067 \text{ unit}\end{aligned}$$

Definition

The **linearization** of a function $f(x, y)$ at a point (x_0, y_0) where f is differentiable is the function

$$L(x, y) = f(x_0, y_0) + f_x \Big|_{(x_0, y_0)} (x - x_0) + f_y \Big|_{(x_0, y_0)} (y - y_0)$$

The approximation $f(x, y) \approx L(x, y)$

is the **standard linear** approximation of f at (x_0, y_0)

Example

Find the linearization of $f(x, y) = x^2 - xy + \frac{1}{2}y^2 + 3$ at the point $(3, 2)$

Solution

$$\begin{aligned} f(3, 2) &= 3^2 - (3)(2) + \frac{1}{2}2^2 + 3 \\ &= 8 \end{aligned}$$

$$\begin{aligned} f_x(3, 2) &= \frac{\partial}{\partial x} \left(x^2 - xy + \frac{1}{2}y^2 + 3 \right) \Big|_{(3,2)} \\ &= 2x - y \Big|_{(3,2)} \\ &= 2(3) - 2 \\ &= 4 \end{aligned}$$

$$\begin{aligned} f_y(3, 2) &= -x + y \Big|_{(3,2)} \\ &= -3 + 2 \\ &= -1 \end{aligned}$$

$$\begin{aligned} L(x, y) &= 8 + 4(x - 3) - 1(y - 2) \\ &= 4x - y - 2 \end{aligned}$$

The Error in the Standard Linear Approximation

If f has continuous first and second partial derivatives throughout an open set containing a rectangle R centered at (x_0, y_0) and if M is any upper bound for the values of $|f_{xx}|$, $|f_{yy}|$, and $|f_{xy}|$ on R , then the error $E(x, y)$ incurred in replacing $F(x, y)$ on R by its linearization

$$L(x, y) = f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0)$$

Satisfies the inequality:

$$|E(x, y)| \leq \frac{1}{2} M \left(|x - x_0| + |y - y_0| \right)^2$$

$$R: |x - x_0| \leq h, \quad |y - y_0| \leq k$$

Example

Find an upper bound for the error in the approximation $f(x, y) \approx L(x, y)$ of $f(x, y) = x^2 - xy + \frac{1}{2}y^2 + 3$ over the rectangle

$$R: |x - 3| \leq 0.1, \quad |y - 2| \leq 0.1$$

Express the upper bound as a percentage of $f(3, 2)$, the value of f at the center of the rectangle.

Solution

$$f_{xx} = \frac{\partial}{\partial x}(2x - y) = 2 \rightarrow |f_{xx}| = 2$$

$$f_{yy} = \frac{\partial}{\partial y}(-x + y) = 1 \rightarrow |f_{yy}| = 1$$

$$f_{xy} = \frac{\partial}{\partial y}(2x - y) = -1 \rightarrow |f_{xy}| = |-1| = 1$$

The largest of these is 2, so let $M = 2$.

$$\begin{aligned}
 |E(x, y)| &\leq \frac{1}{2}M \left(|x - x_0| + |y - y_0| \right)^2 \\
 &= \frac{1}{2}(2)(|x - 3| + |y - 2|)^2 \\
 &= \underline{\left(|x - 3| + |y - 2| \right)^2}
 \end{aligned}$$

Since $|x - 3| \leq 0.1$, $|y - 2| \leq 0.1$

$$\begin{aligned}
 |E(x, y)| &\leq (0.1 + 0.1)^2 \\
 &= \underline{0.04}
 \end{aligned}$$

As a percentage of $f(3, 2) = 8$, the error is no greater than

$$\frac{0.04}{8} \times 100 = \underline{0.5\%}$$

Differentials

Definition

If we move from (x_0, y_0) to a point $(x_0 + dx, y_0 + dy)$ nearby, the resulting change

$$df = f_x(x_0, y_0)dx + f_y(x_0, y_0)dy$$

In the linearization of f is called the **total differential of f** .

Example

Suppose that a cylindrical can is designed to have a radius of 1 in. and a height of 5 in., but that the radius and height are off the amounts $dr = +0.03$ and $dh = -0.1$. Estimate the resulting absolute change in the volume of the can.

Solution

To estimate the absolute change in $V = \pi r^2 h$,

$$\Delta V \approx dV = V_r(r_0, h_0)dr + V_h(r_0, h_0)dh$$

$$\begin{aligned} dV &= (2\pi r_0 h_0)(0.03) + (\pi r_0^2)(-0.1) \\ &= 2\pi(1)(5)(0.03) + \pi(1)^2(-0.1) \\ &= 0.2\pi \\ &\approx \underline{0.63 \text{ in}^3} \end{aligned}$$

Example

Your company manufactures right circular cylindrical molasses storage tanks that are 25 ft with a radius of 5 ft. How sensitive are the tanks' volumes to small variations in height and radius?

Solution

$$V = \pi r^2 h$$

$$\begin{aligned} dV &= V_r(r_0, h_0)dr + V_h(r_0, h_0)dh \\ &= V_r(5, 25)dr + V_h(5, 25)dh \\ &= (2\pi rh)_{(5, 25)}dr + (\pi r^2)_{(5, 25)}dh \\ &= 250\pi dr + 25\pi dh \end{aligned}$$

A 1-unit change in r will change V about 250π units.

A 1-unit change in h will change V about 25π units.

The tanks' volume is 10 times more sensitive to a small change in r than it is to a small change of equal size in h .

$$\begin{aligned} dV &= (2\pi rh)_{(25, 5)} dr + (\pi r^2)_{(25, 5)} dh \\ &= 250\pi dr + 625\pi dh \end{aligned}$$

Now the volume is more sensitive to changes in h than to changes in r .

The general rule is that functions are most sensitive to small changes in the variables that generated the largest partial derivatives.

Example

The volume $V = \pi r^2 h$ of a right circular cylinder is to be calculated from measured values of r and h . Suppose that r is measured with an error of no more than 2% and h with an error of no more than 0.5%. Estimate the resulting possible percentage error in the calculation of V .

Solution

$$\left| \frac{dr}{r} \times 100 \right| \leq 2 \quad \left| \frac{dh}{h} \times 100 \right| \leq 0.5$$

$$\begin{aligned} \frac{dV}{V} &= \frac{2\pi r h dr + \pi r^2 dh}{\pi r^2 h} \\ &= \frac{2dr}{r} + \frac{dh}{h} \end{aligned}$$

$$\begin{aligned} \left| \frac{dV}{V} \right| &= \left| \frac{2dr}{r} + \frac{dh}{h} \right| \\ &\leq \left| 2 \frac{dr}{r} \right| + \left| \frac{dh}{h} \right| \\ &\leq 2(0.02) + 0.005 \\ &= 0.045 \end{aligned}$$

The error in the volume is at the most 4.5%

Functions of More Than Two Variables

- The linearization of $f(x, y, z)$ at a point $P_0(x_0, y_0, z_0)$ is

$$L(x, y, z) = f(P_0) + f_x(P_0)(x - x_0) + f_y(P_0)(y - y_0) + f_z(P_0)(z - z_0)$$

- Suppose that R is a closed rectangular solid centered at P_0 and lying in an open region on which the second partial derivatives of f are continuous. Suppose also that $|f_{xx}|$, $|f_{yy}|$, $|f_{zz}|$, $|f_{xy}|$, $|f_{xz}|$, and $|f_{yz}|$ are all less than or equal to M throughout R . Then the error $E(x, y, z) = f(x, y, z) - L(x, y, z)$ in the approximation of f by L is bounded throughout R by the inequality

$$|E(x, y, z)| \leq \frac{1}{2}M \left(|x - x_0| + |y - y_0| + |z - z_0| \right)^2$$

- If the second partial derivatives of f are continuous and if x , y , and z change from x_0 , y_0 , and z_0 by small amounts dx , dy , and dz , the total differential

$$df = f_x(P_0)dx + f_y(P_0)dy + f_z(P_0)dz$$

Example

Find the linearization $L(x, y, z)$ of $f(x, y, z) = x^2 - xy + 3\sin z$ at the point $(2, 1, 0)$.

Find the upper bound for the error incurred in replacing f by L on the rectangle

$$R: |x - 2| \leq 0.01, |y - 1| \leq 0.02, |z| \leq 0.01$$

Solution

$$f(2, 1, 0) = 2^2 - (2)(1) + 3\sin 0 = 2$$

$f_x(2, 1, 0) = 2x - y = 3$	$f_{xx} = 2$	$f_{xy} = -1$
$f_y(2, 1, 0) = -x = -2$	$f_{yy} = 0$	$f_{xz} = 0$
$f_z(2, 1, 0) = 3\cos z = 3$	$f_{zz} = -3\sin z$	$f_{yz} = 0$

$$|-3\sin z| \leq 3\sin 0.01 \approx 0.03$$

Let $M = 2$.

$$|E| \leq \frac{1}{2}2(0.01 + 0.02 + 0.01)^2$$

$$= 0.0016$$

Exercises **Section 2.6 – Tangent Planes and Linear Approximation**

(1 – 5) Find the tangent plane and normal line of the surface

1. $x^2 + y^2 + z^2 = 3$ at the point $P_0(1, 1, 1)$
2. $x^2 + 2xy - y^2 + z^2 = 7$ at the point $P_0(1, -1, 3)$
3. $\cos \pi x - x^2 y + e^{xz} + yz = 4$ at the point $P_0(0, 1, 2)$
4. $x^2 - xy - y^2 - z = 0$ at the point $P_0(1, 1, -1)$
5. $x^2 + y^2 - 2xy - x + 3y - z = -4$ at the point $P_0(2, -3, 18)$

(6 – 23) Find an equation for the plane that is tangent to the surface

6. $z = \ln(x^2 + y^2)$ at the point $(1, 0, 0)$
7. $z = e^{-x^2 - y^2}$ at the point $(0, 0, 1)$
8. $z = \sqrt{y - x}$ at the point $(1, 2, 1)$
9. $z = 2x^2 + y^2$; $(1, 1, 3)$ and $(0, 2, 4)$
10. $x^2 + \frac{1}{4}y^2 - \frac{1}{9}z^2 = 1$; $(0, 2, 0)$ and $(1, 1, \frac{3}{2})$
11. $xy \sin z - 1 = 0$; $(1, 2, \frac{\pi}{6})$ and $(-2, -1, \frac{5\pi}{6})$
12. $yz e^{xz} - 8 = 0$; $(0, 2, 4)$ and $(0, -8, -1)$
13. $z = x^2 e^{x-y}$; $(2, 2, 4)$ and $(-1, -1, 1)$
14. $z = \ln(1 + xy)$; $(1, 2, \ln 3)$ and $(-2, -1, \ln 3)$
15. $z = f(x, y) = \frac{1}{x^2 + y^2}$ at the point $(1, 1, \frac{1}{2})$
16. $x^2 + y + z = 3$; $(1, 1, 1)$ and $(2, 0, -1)$
17. $x^2 + y^3 + z^4 = 2$; $(1, 0, 1)$ and $(-1, 0, 1)$
18. $xy + xz + yz = 12$; $(2, 2, 2)$ and $(2, 0, 6)$
19. $x^2 + y^2 - z^2 = 0$; $(3, 4, 5)$ and $(-4, -3, 5)$
20. $xy \sin z = 1$; $(1, 2, \frac{\pi}{6})$ and $(-2, -1, \frac{5\pi}{6})$

21. $yez^{xz} = 8$; $(0, 2, 4)$ and $(0, -8, -1)$
22. $z^2 - \frac{x^2}{16} - \frac{y^2}{9} = 1$; $(4, 3, -\sqrt{3})$ and $(-8, 9, \sqrt{14})$
23. $2x + y^2 - z^2 = 0$; $(0, 1, 1)$ and $(4, 1, -3)$
- (24 – 27) Find parametric equation for the line tangent to the curve of intersection of the surfaces
24. $x + y^2 + 2z = 4$, $x = 1$ at the point $(1, 1, 1)$
25. $xyz = 1$, $x^2 + 2y^2 + 3z^2 = 6$ at the point $(1, 1, 1)$
26. $x^3 + 3x^2y^2 + y^3 + 4xy - z^2 = 0$, $x^2 + y^2 + z^2 = 11$ at the point $(1, 1, 3)$
27. $x^2 + y^2 = 4$, $x^2 + y^2 - z = 0$ at the point $(\sqrt{2}, \sqrt{2}, 4)$
28. Find an equation for the plane tangent to the level surface $f(x, y, z) = x^2 - y - 5z$ at the point $P_0(2, -1, 1)$. Also, find parametric equations for the line is normal to the surface at P_0 .
29. By about how much will $f(x, y, z) = \ln \sqrt{x^2 + y^2 + z^2}$ change if the point $P(x, y, z)$ moves from $P_0(3, 4, 12)$ a distance of $ds = 0.1$ unit in the direction of $3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}$?
30. By about how much will $f(x, y, z) = e^x \cos yz$ change if the point $P(x, y, z)$ moves from the origin at distance of $ds = 0.1$ unit in the direction of $2\hat{i} + 2\hat{j} - 2\hat{k}$?
- (31 – 38) Find the linearization $L(x, y)$ of
31. $f(x, y) = x^2 + y^2 + 1$ at the point $(0, 0)$ and $(1, 1)$
32. $f(x, y) = (x + y + 2)^2$ at the point $(0, 0)$ and $(1, 2)$
33. $f(x, y) = x^3y^4$ at the point $(1, 1)$ and $(0, 0)$
34. $f(x, y) = e^{2y-x}$ at the point $(0, 0)$ and $(1, 2)$
35. $f(x, y, z) = x^2 + y^2 + z^2$ at the point $(1, 1, 1)$
36. $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ at the point $(1, 2, 2)$
37. $f(x, y, z) = \frac{\sin xy}{z}$ at the point $(\frac{\pi}{2}, 1, 1)$
38. $f(x, y, z) = e^x + \cos(y + z)$ at the point $(0, \frac{\pi}{4}, \frac{\pi}{4})$

(39 – 46) Find the linear approximation to the function f at the point (a, b) and estimate the given function value

39. $f(x, y) = 4 \cos(2x - y)$; $(a, b) = \left(\frac{\pi}{4}, \frac{\pi}{4}\right)$; estimate $f(0.8, 0.8)$

40. $f(x, y) = (x + y)e^{xy}$; $(a, b) = (2, 0)$; estimate $f(1.95, 0.05)$

41. $f(x, y) = xy + x - y$; $(a, b) = (2, 3)$; estimate $f(2.1, 2.99)$

42. $f(x, y) = 12 - 4x^2 - 8y^2$; $(a, b) = (-1, 4)$; estimate $f(-1.05, 3.95)$

43. $f(x, y) = -x^2 + 2y^2$; $(a, b) = (3, -1)$; estimate $f(3.1, -1.04)$

44. $f(x, y) = \sqrt{x^2 + y^2}$; $(a, b) = (3, -4)$; estimate $f(3.06, -3.92)$

45. $f(x, y) = \ln(1 + x + y)$; $(a, b) = (0, 0)$; estimate $f(0.1, -0.2)$

46. $f(x, y) = \frac{x + y}{x - y}$; $(a, b) = (3, 2)$; estimate $f(2.95, 2.05)$

47. Estimate the change in the function $f(x, y) = -2y^2 + 3x^2 + xy$ when (x, y) changes from $(1, -2)$ to $(1.05, -1.9)$.

48. What is the largest value that the directional derivative of $f(x, y, z) = xyz$ can have at the point $(1, 1, 1)$?

49. You plan to calculate the volume inside a stretch of pipeline that is about 36 in. in diameter and 1 mile long. With which measurement should you be more careful, the length or the diameter? Why?

50. The volume of a cylinder with radius r and height h is $V = \pi r^2 h$. Find the approximate percentage change in the volume when the radius decreases by 3% and the height increases by 2%.

51. The volume of an ellipsoid with axes of length $2a$, $2b$, and $2c$ is $V = \pi abc$. Find the percentage change in the volume when a increases by 2%, b increases by 1.5%, and c decreases by 2.5%.

52. A hemispherical tank with a radius of 1.50 m is filled with water to a depth of 1.00 m. Water level drops by 0.05 m (from 1.00 m to 0.95 m)

- a) Approximate the change in the volume of water in the tank. The volume of a spherical cap is $V = \frac{1}{3}\pi h^2(3r - h)$, where r is the radius of the sphere and h is the thickness of the cap (in this case, the depth of the water).
- b) Approximate the change in the surface area of the water in the tank.

53. Consider a closed rectangular box with a square base. If x is measured with error at most 2% and y is measured with error at most 3% use a differential to estimate the corresponding percentage error in computing the box's

- a) Surface area
- b) Volume

54. Consider a closed container in the shape of a cylinder of radius 10 cm and height 15 cm with a hemisphere on each end.

The container is coated with a layer of ice $\frac{1}{2}$ cm thick. Use a differential to estimate the total volume of ice. (*Hint:* assume r is radius with $dr = \frac{1}{2}$ and h is height with $dh = 0$)

55. A standard 12-fl-oz can of soda is essentially a cylinder of radius $r = 1$ in and height $h = 5$ in.
- a) At these dimensions, how sensitive is the can's volume to a small change in radius versus a small change in height?
- b) Could you design a soda can that appears to hold more soda but in fact holds the same 12-fl-oz? What might its dimensions be? (There is more than one correct answer.)

56. Consider the function $f(x, y) = 2x^2 - 4y^2 + 10$, whose graph is shown

- a) Fill in the table showing the value of the directional derivative at points (a, b) in the direction given by the unit vectors \mathbf{u} , \mathbf{v} , and \mathbf{w}

	$(a, b) = (0, 0)$	$(a, b) = (2, 0)$	$(a, b) = (1, 1)$
$\mathbf{u} = \left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right)$			
$\mathbf{v} = \left(-\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right)$			
$\mathbf{w} = \left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2} \right)$			

- b) Interpret each of the directional derivatives computed in part(a) at the point $(2, 0)$

57. Two spheres have the same center and radii r and R , where $0 < r < R$. The volume of the region between the sphere is $V(r, R) = \frac{4\pi}{3}(R^3 - r^3)$.

- a) First use your intuition. If r is held fixed, how does V change as R increases? What is the sign of V_R ? If R is held fixed, how does V change as r increases (up to the value of R)? What is the sign of V_r ?
- b) Compute V_r and V_R . Are the results consistent with part (a)?
- c) Consider spheres with $R = 3$ and $r = 1$. Does the volume change more if R is increased by $\Delta R = 0.1$ (with r fixed) or if r is decreased by $\Delta r = 0.1$ (with R fixed)?

58. A company manufactures cylindrical aluminum tubes to rigid specifications. The tubes are designed to have an outside radius of $r = 10 \text{ cm}$, a height of $h = 50 \text{ cm}$, and a thickness of $t = 0.1 \text{ cm}$. The manufacturing process produces tubes with a maximum error of $\pm 0.05 \text{ cm}$ in the radius and height and a maximum error of $\pm 0.0005 \text{ cm}$ in the thickness. The volume of the material used to construct a cylindrical tube is $V(r, h, t) = \pi h t (2r - t)$. Estimate maximum error in the volume of the tube.

59. The volume of a right circular cone with radius r and height h is $V = \frac{1}{3} \pi h r^2$
- Approximate the change in the volume of the cone when the radius changes from $r = 6.5$ to $r = 6.6$ and the height changes from $h = 4.20$ to $h = 4.15$
 - Approximate the change in the volume of the cone when the radius changes from $r = 5.4$ to $r = 5.37$ and the height changes from $h = 12.0$ to $h = 11.96$
60. The area of an ellipse with axes of length $2a$ and $2b$ is $A = \pi ab$. Approximate the percent change in the area when a increases by 2% and b increases by 1.5%.
61. The Volume of a segment of a circular paraboloid with radius r and height h is $V = \frac{1}{2} \pi h r^2$.

Approximate the percent change in the volume when the radius decreases by 1.5% and the height increases by 2.2%

62. Batting averages in baseball are defined by $A = \frac{x}{y}$, where $x \geq 0$ is the total number of hits and $y > 0$ is the total number of at-bats. Treat x and y as positive real numbers and note that $0 \leq A \leq 1$.
- Estimate the change in the batting average if the number of hits increases from 60 to 62 and the number of at-bats increases from 175 to 180.
 - If a batter currently has a batting average of $A = 0.35$, does the average decrease if the batter fails to get a hit more than it increases if the batter gets a hit?
 - Does the answer in part (b) depend on the current batting average? Explain.
63. A conical tank with radius 0.50 m and height 2.0 m is filled with water.

Water released from the tank, and the water level drops by 0.05 m (from 2.0 m to 1.95 m). Approximate the change in volume of water in the tank.
(Hint: When the water level drops, both the radius and height of the cone of water change).

64. Poiseuille's law is a fundamental law of fluid dynamics that describes the flow velocity of a viscous incompressible fluid in a cylinder (it is used to model blood flow through veins and arteries). It says that in a cylinder of radius R and length L , the velocity of the fluid $r \leq R$ units from the centerline of the cylinder is $V = \frac{P}{4Lv} (R^2 - r^2)$, where P is the difference in the pressure between the ends of the cylinder and v is the viscosity of the fluid. Assuming that P and v are constant, the velocity V along the centerline of the cylinder ($r = 0$) is $V = \frac{kR^2}{L}$, where k is a constant that we will take to be $k = 1$.

- Estimate the change in the centerline velocity ($r = 0$) if the radius of the flow cylinder increases from $R = 3 \text{ cm}$ to $R = 3.05 \text{ cm}$ and the length increases from $L = 50 \text{ cm}$ to $L = 50.5 \text{ cm}$.

- b) Estimate the percent change in the centerline velocity if the radius of the flow cylinder R decreases by 1% and the length increases by 2%.

65. Suppose that in a large group of people a fraction $0 \leq r \leq 1$ of the people have flu. The probability that in n random encounters, you will meet at least one person with flu is $P = f(n, r) = 1 - (1 - r)^n$. although n is a positive integer, regard it as a positive real number.

- Compute f_r and f_n .
- How sensitive is the probability P to the flu rate r ? Suppose you meet $n = 20$ people. Approximately how much does the probability P increase if the flu rate increases from $r = 0.1$ to $r = 0.11$ (with n fixed)?
- Approximately how much does the probability P increase the flu rate increases from $r = 0.9$ to $r = 0.91$
- Interpret the results of parts (b) and (c).

66. When two electrical resistors with resistance $R_1 > 0$ and $R_2 > 0$ are wired in parallel in a circuit, the combined resistance R is given by

- Estimate the change in R if R_1 increases from 2Ω to 2.05Ω and R_2 decreases from 3Ω to 2.95Ω .
- Is it true that if $R_1 = R_2$ and R_1 increases by the same small amount as R_2 decreases, then R is approximately unchanged? Explain.
- Is it true that if R_1 and R_2 increase, then R increases? Explain.
- Suppose $R_1 > R_2$ and R_1 increases by the same small amount as R_2 decreases. Does R increase or decrease?

67. When three electrical resistors with resistance $R_1 > 0$, $R_2 > 0$ and $R_3 > 0$ are wired in parallel in a circuit, the combined resistance R is given by

Estimate the change in R if R_1 increases from $2\ \Omega$ to $2.05\ \Omega$, R_2 decreases from $3\ \Omega$ to $2.95\ \Omega$, and R_3 increases from $1.5\ \Omega$ to $1.55\ \Omega$

- 68.** Consider the ellipsoid $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ and the plane P given by $Ax + By + Cz + 1 = 0$. Let

$$h = \frac{1}{\sqrt{A^2 + B^2 + C^2}} \quad \text{and} \quad m = \sqrt{a^2 A^2 + b^2 B^2 + c^2 C^2}$$

- Find the equation of the plane tangent to the ellipsoid at the point (p, q, r) .
- Find the two points on the ellipsoid at which the tangent plane parallel to P and find equations of the tangent planes.
- Show that the distance between the origin and the plane P is h .
- Show that the distance between the origin and the tangent planes is hm .
- Find a condition that guarantees the plane P does not intersect the ellipsoid.

Section 2.7 – Maximum/Minimum Problems

Derivative Tests for Local Extreme Values

Definition

Let $f(x, y)$ be defined on a region R containing the point (a, b) . Then

- $f(a, b)$ is a local maximum value of f if $f(a, b) \geq f(x, y)$ for all domain points (x, y) in an open disk centered at (a, b) .
- $f(a, b)$ is a local minimum value of f if $f(a, b) \leq f(x, y)$ for all domain points (x, y) in an open disk centered at (a, b) .

$$z = (\cos x)(\cos y)e^{-\sqrt{x^2+y^2}}$$

$$z = \frac{1}{2}(|x| - |y| - |x| - |y|)$$

Theorem – First derivative Test for Local Extreme Values

If $f(x, y)$ has a local maximum or minimum value at an interior point (a, b) of its domain and if the first partial derivatives exist there, then $f_x(a, b) = 0$ and $f_y(a, b) = 0$

Definition

An interior point of the domain $f(x, y)$ where both f_x and f_y are zero or where one or both of f_x and f_y do not exist is a **critical point** of f .

Definition

A differentiable function $f(x, y)$ has a **saddle point** at a critical point (a, b) if in every open disk centered at (a, b) there are domain points (x, y) where $f(x, y) > f(a, b)$ and domain points (x, y) where $f(x, y) < f(a, b)$. The corresponding point $(a, b, f(a, b))$ on the surface $z = f(x, y)$ is called a saddle point of the surface.

$$z = \frac{xy(x^2 - y^2)}{x^2 + y^2}$$

$$z = y^2 - y^4 - x^2$$

Example

Find the local extreme values of $f(x, y) = x^2 + y^2 - 4y + 9$

Solution

The domain of f is the entire plane. The local extreme values occur:

$$f_x = 2x = 0 \quad f_y = 2y - 4 = 0$$

Therefore, the critical point is $(0, 2)$ and the value $f(0, 2) = 0 + 2^2 - 8 + 9 = 5$.

The critical point is a local minimum.

Example

Find the local extreme values of $f(x, y) = y^2 - x^2$

Solution

The domain of f is the entire plane.

$$f_x = -2x = 0 \quad f_y = 2y = 0$$

Therefore, the local extreme is the origin $(0, 0)$ and the value $f(0, 0) = 0$.

$$f(0, y) = y^2 \geq 0 \quad f(x, 0) = -x^2 \leq 0$$

The function has a saddle point at the origin and no local extreme values.

Theorem – Second Derivative Test for Local Extreme Values

Suppose that $f(x, y)$ and its first and second partial derivatives are continuous throughout a disk centered at (a, b) and that $f_x(a, b) = f_y(a, b) = 0$. Then

- f has a **local maximum** at (a, b) if $f_{xx} < 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at (a, b) .
- f has a **local minimum** at (a, b) if $f_{xx} > 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at (a, b) .
- f has a **saddle point** at (a, b) if $f_{xx}f_{yy} - f_{xy}^2 < 0$ at (a, b) .
- **The test is inconclusive** at (a, b) if $f_{xx}f_{yy} - f_{xy}^2 = 0$ at (a, b) . In this case, we must find some other way to determine the behavior of f at (a, b) .

Example

Find the local extreme values of $f(x, y) = xy - x^2 - y^2 - 2x - 2y + 4$

Solution

$$f_x = y - 2x - 2 = 0 \quad f_y = x - 2y - 2 = 0$$

$$\begin{cases} -2x + y = 2 \\ x - 2y = 2 \end{cases} \rightarrow \boxed{x = y = -2}$$

Therefore, the critical point is $(-2, -2)$

$$f_{xx} = -2 \quad f_{yy} = -2 \quad f_{xy} = 1$$

$$f_{xx}f_{yy} - f_{xy}^2 = (-2)(-2) - 1^2 = 3 > 0$$

$$f_{xx} = -2 < 0$$

The function f has a local maximum at $(-2, -2)$ and the value is

$$\begin{aligned} f(-2, -2) &= (-2)(-2) - (-2)^2 - (-2)^2 - 2(-2) - 2(-2) + 4 \\ &= 8 \end{aligned}$$

Example

Find the local extreme values of $f(x, y) = 3y^2 - 2y^3 - 3x^2 + 6xy$

Solution

$$f_x = -6x + 6y = 0 \quad \text{and} \quad f_y = 6y - 6y^2 + 6x = 0$$

$$\begin{cases} -6x + 6y = 0 \\ 6y - 6y^2 + 6x = 0 \end{cases} \rightarrow \begin{matrix} x = y \\ 6y - 6y^2 + 6y = -6y(y - 2) = 0 \end{matrix}$$

$$\begin{cases} y = 0 = x & \boxed{(0, 0)} \\ y = 2 = x & \boxed{(2, 2)} \end{cases} \text{ are the critical points}$$

$$f_{xx} = -6 \quad f_y = 6 - 12y \quad f_{xy} = 6$$

$$\begin{aligned} f_{xx}f_{yy} - f_{xy}^2 &= (-6)(6 - 12y) - 6^2 \\ &= -36 + 72y - 36 \\ &= 72(y - 1) \end{aligned}$$

At $(0, 0)$

$$f_{xx}f_{yy} - f_{xy}^2 = -72 < 0$$

So, the function has a saddle point at the origin.

At $(2, 2)$

$$f_{xx}f_{yy} - f_{xy}^2 = 72 > 0 \quad \text{and} \quad f_{xx} = -6 < 0$$

So, the function has a local maximum at $(2, 2)$ with a value of

$$\begin{aligned} f(2, 2) &= 12 - 16 - 12 + 24 \\ &= 8 \end{aligned}$$

Absolute Maxima and Minima on Closed Bounded Regions

The absolute extrema of a continuous function $f(x, y)$ on a closed and bounded region R into three steps

1. List the interior points of R where f may have local maxima and minima and evaluate f at these points. These are the critical points of f .
2. List the boundary points of R where f may have local maxima and minima and evaluate f at these points.
3. Look through the lists for the maximum and minimum values of f . These will be the absolute maximum and minimum values of f on R . Since absolute maxima and minima are also local maxima and minima, the absolute maximum and minimum values of appear somewhere in the lists made in Steps 1 and 2

Example

Find the absolute maximum and minimum values of $f(x, y) = 2 + 2x + 2y - x^2 - y^2$ on the triangular region in the first quadrant bounded by the lines $x = 0$, $y = 0$, $y = 9 - x$

Solution

$$f_x = 2 - 2x = 0 \quad f_y = 2 - 2y = 0$$

$$x = 1 \quad y = 1$$

The critical point is $(1, 1)$. The value of f is

$$f(1, 1) = 2 + 2 + 2 - 1 - 1 = \underline{4}$$

Boundary points:

- i. On the segment OA , $y = 0$. The function

$$f(x, 0) = 2 + 2x - x^2$$

This function is defined on the closed interval $0 \leq x \leq 9$.

$$\begin{cases} x=0 & \rightarrow f(0, 0) = \underline{2} \\ x=9 & \rightarrow f(9, 0) = 2 + 18 - 81 = \underline{-61} \end{cases}$$

At the interior points where $f_x = 0$. The only point is $x = 1$ where $f(1, 0) = 3$

ii. On the segment OB , $x = 0$. The function

$$f(0, y) = 2 + 2y - y^2$$

$$f(0, 0) = 2, \quad f(0, 9) = -61, \quad f(1, 0) = 3$$

iii. Left the interior points of the segment AB . With $y = 9 - x$, then

$$\begin{aligned} f(x, y) &= 2 + 2x + 2(9 - x) - x^2 - (9 - x)^2 \\ &= 2 + 2x + 18 - 2x - x^2 - 81 + 18x - x^2 \\ &= -2x^2 + 18x - 61 \end{aligned}$$

$$f'(x, 9 - x) = -4x + 18 = 0 \Rightarrow \underline{x = \frac{9}{2}}$$

$$\text{At } x = \frac{9}{2} \Rightarrow y = 9 - x = \frac{9}{2}$$

$$\begin{aligned} f\left(\frac{9}{2}, \frac{9}{2}\right) &= 2 + 2\left(\frac{9}{2}\right) + 2\left(9 - \frac{9}{2}\right) - \left(\frac{9}{2}\right)^2 - \left(9 - \frac{9}{2}\right)^2 \\ &= \underline{-\frac{41}{2}} \end{aligned}$$

$$\therefore 4, 2, -61, 3, -\frac{41}{2}.$$

The maximum is 4, which f assumes at $(1, 1)$. The minimum is -61 , which f assumes at $(0, 9)$ and $(9, 0)$.

Example

A delivery company accepts only rectangular boxes the sum of whose length and girth (perimeter of a cross-section) does not exceed 108 in. Find the dimensions of an acceptable box of largest volume.

Solution

Let x , y , and z represent the length, width, and height.

The girth is: $= 2y + 2z (= P)$

Volume: $V = xyz$

We want to maximize the volume of the box satisfying:

$$x + 2y + 2z = 108$$

$$x = 108 - 2y - 2z$$

$$\begin{aligned} V(y, z) &= (108 - 2y - 2z)yz \\ &= 108yz - 2y^2z - 2yz^2 \end{aligned}$$

$$\begin{aligned} V_y(y, z) &= 108z - 4yz - 2z^2 \\ &= 2z(54 - 2y - z) = 0 \end{aligned}$$

$$\begin{aligned} V_z(y, z) &= 108y - 2y^2 - 4yz \\ &= 2y(54 - y - 2z) = 0 \end{aligned}$$

$$\begin{cases} 2z(54 - 2y - z) = 0 \rightarrow \boxed{z = 0} & 54 - 2y - z = 0 \\ 2y(54 - y - 2z) = 0 \rightarrow \boxed{y = 0} & 54 - y - 2z = 0 \end{cases}$$

$$\begin{cases} 2y + z = 54 \\ y + 2z = 54 \end{cases} \rightarrow \boxed{y = z = 18}$$

$$\begin{cases} \text{if } y = 0 & 54 - 2y - z = 0 \Rightarrow z = 54 \rightarrow \boxed{(0, 54)} \\ \text{if } z = 0 & 54 - y - 2z = 0 \Rightarrow y = 54 \rightarrow \boxed{(54, 0)} \end{cases}$$

\therefore The critical points are: $(0, 0)$, $(0, 54)$, $(54, 0)$, $(18, 18)$

At $(0, 0)$:

$$V(0, 0) = 108yz - 2y^2z - 2yz^2 \Big|_{(0,0)} = 0$$

At $(0, 54)$:

$$V(0, 54) = 108yz - 2y^2z - 2yz^2 \Big|_{(0,54)} = 0$$

At $(54, 0)$:

$$V(54, 0) = 108yz - 2y^2z - 2yz^2 \Big|_{(54,0)} = 0$$

At (18, 18):

$$V(18,18) = 108yz - 2y^2z - 2yz^2 \Big|_{(18,18)} = 11,664$$

$$V_{yy} = -4z, \quad V_{zz} = -4y, \quad V_{yz} = 108 - 4y - 4z$$

$$\begin{aligned} V_{xx}V_{yy} - V_{xy}^2 &= (-4z)(-4y) - (108 - 4y - 4z)^2 \\ &= \left[16yz - 16(27 - y - z)^2 \right]_{(18,18)} \\ &= 16(18)(18) - 16(27 - 18 - 18)^2 \\ &= 3888 > 0 \end{aligned}$$

$$V_{yy}(18,18) = -4(18) < 0$$

That implies (18, 18) give a maximum volume.

$$\underline{x} = 108 - 2(18) - 2(18) = \underline{36}$$

$$\begin{aligned} V = xyz &= 36(18)(18) \\ &= \underline{11,664} \end{aligned}$$

The dimensions of the package are: $x = 36 \text{ in.}$, $y = 18 \text{ in.}$, $z = 18 \text{ in.}$

The maximum volume is $11,664 \text{ in}^3$

Summary of *Max–Min* Tests

The extreme values of $f(x, y)$ can occur only at

- i. **Boundary points** of the domain of f .
- ii. **Critical points** (interior points where $f_x = f_y = 0$ or points where f_x or f_y fail to exist)

If the first- and second-order partial derivatives of f are continuous throughout a disk centered at a point (a, b) and $f_x(a, b) = f_y(a, b) = 0$, the nature of $f(a, b)$ can be tested with the **Second Derivative**

Test:

- i. $f_{xx} < 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b) \Rightarrow$ **local maximum**
- ii. $f_{xx} > 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b) \Rightarrow$ **local minimum**
- iii. $f_{xx}f_{yy} - f_{xy}^2 < 0$ at $(a, b) \Rightarrow$ **saddle point**
- iv. $f_{xx}f_{yy} - f_{xy}^2 = 0$ at $(a, b) \Rightarrow$ **test is inconclusive.**

Exercises 2.7 – Maximum/Minimum Problems

(1 – 30) Find all the local maxima, local minima, and saddle points of the function

1. $f(x, y) = x^2 + xy + y^2 + 3x - 3y + 4$

2. $f(x, y) = x^2 - xy + y^2 + 2x + 2y - 4$

3. $f(x, y) = x^3 + y^3 - 3xy + 15$

4. $f(x, y) = x^4 - 8x^2 + 3y^2 - 6y$

5. $f(x, y) = 2xy - 5x^2 - 2y^2 + 4x + 4y - 4$

6. $f(x, y) = x^2 - 4xy + y^2 + 6y + 2$

7. $f(x, y) = 2x^2 + 3xy + 4y^2 - 5x + 2y$

8. $f(x, y) = x^2 - y^2 - 2x + 4y + 6$

9. $f(x, y) = \sqrt{56x^2 - 8y^2 - 16x - 31} + 1 - 8x$

10. $f(x, y) = 1 - \sqrt[3]{x^2 + y^2}$

11. $f(x, y) = x^3 + y^3 + 3x^2 - 3y^2 - 8$

12. $f(x, y) = 4xy - x^4 - y^4$

13. $f(x, y) = \frac{1}{x^2 + y^2 - 1}$

14. $f(x, y) = \frac{1}{x} + xy + \frac{1}{y}$

15. $f(x, y) = y \sin x$

16. $f(x, y) = e^{2x} \cos y$

17. $f(x, y) = e^y - ye^x$

18. $f(x, y) = e^{-y} (x^2 + y^2)$

19. $f(x, y) = 2 \ln x + \ln y - 4x - y$

20. $f(x, y) = \ln(x + y) + x^2 - y$

21. $f(x, y) = 1 + x^2 + y^2$

22. $f(x, y) = x^2 - 6x + y^2 + 8y$

23. $f(x, y) = (3x - 2)^2 + (y - 4)^2$

24. $f(x, y) = 3x^2 - 4y^2$

25. $f(x, y) = x^4 + y^4 - 16xy$

26. $f(x, y) = \frac{1}{3}x^3 - \frac{1}{3}y^3 + 3xy$

27. $f(x, y) = x^4 - 2x^2 + y^2 - 4y + 5$

28. $f(x, y) = x^2 + xy - 2x - y + 1$

29. $f(x, y) = x^2 + 6x + y^2 + 8$

30. $f(x, y) = e^{x^2 y^2 - 2xy^2 + y^2}$

(31 – 34) Identify the critical points of the functions. Then determine whether each critical point corresponds to a local maximum, local minimum, or saddle point. State when your analysis is inconclusive.

31. $f(x, y) = x^4 + y^4 - 16xy$

33. $f(x, y) = xy(2 + x)(y - 3)$

32. $f(x, y) = \frac{1}{3}x^3 - \frac{1}{3}y^3 + 2xy$

34. $f(x, y) = 10 - x^3 - y^3 - 3x^2 + 3y^2$

(35 – 53) Find the absolute maximum and minimum values of the function on the specified region R .

35. $f(x, y) = \frac{1}{3}x^3 - \frac{1}{3}y^3 + 2xy$ on the rectangle $R = \{(x, y) : 0 \leq x \leq 3, -1 \leq y \leq 1\}$

36. $f(x, y) = x^4 + y^4 - 4xy + 1$ on the square $R = \{(x, y) : -2 \leq x \leq 2, -2 \leq y \leq 2\}$

37. $f(x, y) = x^2 y - y^3$ on the triangle $R = \{(x, y) : 0 \leq x \leq 2, 0 \leq y \leq 2 - x\}$

38. $f(x, y) = xy$ on the semicircular disk $R = \{(x, y): -1 \leq x \leq 1, 0 \leq y \leq \sqrt{1-x^2}\}$
39. $f(x, y) = x^2 + y^2 - 2y + 1$; $R = \{(x, y): x^2 + y^2 \leq 4\}$
40. $f(x, y) = 2x^2 + y^2$; $R = \{(x, y): x^2 + y^2 \leq 16\}$
41. $f(x, y) = 4 + 2x^2 + y^2$; $R = \{(x, y): -1 \leq x \leq 1, -1 \leq y \leq 1\}$
42. $f(x, y) = 6 - x^2 - 4y^2$; $R = \{(x, y): -2 \leq x \leq 2, -1 \leq y \leq 1\}$
43. $f(x, y) = 2x^2 - 4x + 3y^2 + 2$; $R = \{(x, y): (x-1)^2 + y^2 \leq 1\}$
44. $f(x, y) = -2x^2 + 4x - 3y^2 - 6y - 1$; $R = \{(x, y): (x-1)^2 + (y+1)^2 \leq 1\}$
45. $f(x, y) = \sqrt{x^2 + y^2 - 2x + 2}$; $R = \{(x, y): x^2 + y^2 \leq 4, y \geq 0\}$
46. $f(x, y) = \frac{-x^2 + 2y^2}{2 + 2x^2y^2}$; R is the closed region bounded by the lines $y = x$, $y = 2x$, and $y = 2$
47. $f(x, y) = \sqrt{x^2 + y^2}$; R is the closed region bounded by the ellipse $\frac{x^2}{4} + y^2 = 1$
48. $f(x, y) = x^2 + y^2 - 4$; $R = \{(x, y): x^2 + y^2 < 4\}$
49. $f(x, y) = x + 3y$; $R = \{(x, y): |x| < 1, |y| < 2\}$
50. $f(x, y) = 2e^{-x-y}$; $R = \{(x, y): x \geq 0, y \geq 0\}$
51. $f(x, y) = 2x^2 - 4x + y^2 - 4y + 1$ on the closed triangular plate bounded by the lines $x = 0$, $y = 2$, $y = 2x$ in the first quadrant.
52. $D(x, y) = x^2 - xy + y^2 + 1$ on the closed triangular plate bounded by the lines $x = 0$, $y = 4$, $y = x$ in the first quadrant.
53. $T(x, y) = x^2 + xy + y^2 - 6x + 2$ on the triangular plate $0 \leq x \leq 5$, $-3 \leq y \leq 0$.
54. Find the point on the graph of $z = x^2 + y^2 + 10$ nearest the plane $x + 2y - z = 0$
55. Find the minimum distance from the point $(2, -1, 1)$ to the plane $x + y - z = 2$
56. Find the maximum value of $s = xy + yz + xz$ where $x + y + z = 6$

57. Find the absolute maxima and minima of the function $f(x, y) = (4x - x^2) \cos y$ on the triangular plate $1 \leq x \leq 3$, $-\frac{\pi}{4} \leq y \leq \frac{\pi}{4}$.

58. Among all triangles with a perimeter of 9 units, find the dimensions of the triangle with the maximum area. It may be easiest to use Heron's formula, which states that the area of a triangle with side length a , b , and c is $A = \sqrt{s(s-a)(s-b)(s-c)}$, where $2s$ is the perimeter of the triangle.
59. Let P be a plane tangent to the ellipsoid $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ at a point in the first octant. Let T be the tetrahedron in the first octant bounded by P and the coordinate planes $x = 0$, $y = 0$, and $z = 0$. Find the minimum volume T . (the volume of a tetrahedron is one-third the area of the base times the height.)
60. Given three distinct noncollinear points A , B , and C in the plane, find the point P in the plane such that the sum of the distances $|AP| + |BP| + |CP|$ is a minimum. Here is how to proceed with three points, assuming that the triangle formed by the three points has no angle greater than $\left(120^\circ = \frac{2\pi}{3}\right)$
- Assume the coordinates of the three given points are $A(x_1, y_1)$, $B(x_2, y_2)$, and $C(x_3, y_3)$. Let $d_1(x, y)$ be the distance between $A(x_1, y_1)$ and a variable point $P(x, y)$. Compute the gradient of d_1 and show that it is a unit vector pointing along the line between the two points.
 - Define d_2 and d_3 in a similar way and show that ∇d_2 and ∇d_3 are also unit vectors in the direction of line between the two points.
 - The goal is to minimize $f(x, y, z) = d_1 + d_2 + d_3$. Show that the condition $f_x = f_y = 0$ implies that $\nabla d_1 + \nabla d_2 + \nabla d_3 = 0$.

- d) Explain why part (c) implies that the optimal point P has the property the the three line segments AP , BP , and CP all intersect symmetrically in angles of $\frac{2\pi}{3}$.
- e) What is the optimal solution if one of the angles in the triangle is greater than $\frac{2\pi}{3}$ (draw a picture)?
- f) Estimate the Steiner point for the three points $(0, 0)$, $(0, 1)$, $(2, 0)$

(61 – 62) Show that the following two functions have two local maxima but no other extreme points (thus no saddle or basin between the mountains).

61. $f(x, y) = -\left(x^2 - 1\right)^2 - \left(x^2 - e^y\right)^2$

62. $f(x, y) = 4x^2e^y - 2x^4 - e^{4y}$

Section 2.8 – Lagrange Multipliers

Constrained Maxima and Minima

We consider a problem where a constrained minimum can be found by eliminating a variable.

Example

Find the point $P(x, y, z)$ on the plane $2x + y - z - 5 = 0$ that is closest to the origin.

Solution

$$\begin{aligned} |\overline{OP}| &= \sqrt{(x-0)^2 + (y-0)^2 + (z-0)^2} \\ &= \sqrt{x^2 + y^2 + z^2} \end{aligned}$$

Subject to the constraint that $2x + y - z - 5 = 0$

Since $|\overline{OP}|$ has a minimum value wherever the function $f(x, y, z) = x^2 + y^2 + z^2$ has a minimum value.

$$2x + y - z - 5 = 0 \Rightarrow z = 2x + y - 5$$

$$\begin{aligned} h(x, y) &= f(x, y, 2x + y - 5) \\ &= x^2 + y^2 + (2x + y - 5)^2 \end{aligned}$$

$\begin{aligned} h_x &= 2x + 2(2x + y - 5)(2) \\ &= 10x + 4y - 20 = 0 \end{aligned}$	$\begin{aligned} h_y &= 2y + 2(2x + y - 5)(1) \\ &= 4x + 4y - 10 = 0 \end{aligned}$
--	---

$$\rightarrow \begin{cases} 10x + 4y = 20 \\ 4x + 4y = 10 \end{cases} \Rightarrow \boxed{x = \frac{5}{3}, y = \frac{5}{6}}$$

$$\underline{z} = 2\left(\frac{5}{3}\right) + \frac{5}{6} - 5 = -\frac{5}{6}$$

Therefore, the closest point to the origin is: $P\left(\frac{5}{3}, \frac{5}{6}, -\frac{5}{6}\right)$

The distance from P to the origin is:

$$\begin{aligned} \sqrt{\left(\frac{5}{3}\right)^2 + \left(\frac{5}{6}\right)^2 + \left(-\frac{5}{6}\right)^2} &= \frac{5\sqrt{6}}{6} \\ &\approx 2.04 \end{aligned}$$

Example

Find the points on the hyperbolic cylinder $x^2 - z^2 - 1 = 0$ that are closest to the origin.

Solution

The points closest to the origin are the points whose coordinates minimize the value of the function

$$f(x, y, z) = x^2 + y^2 + z^2 \text{ subject to the constraint that } x^2 - z^2 - 1 = 0$$

$$x^2 - z^2 - 1 = 0 \rightarrow z^2 = x^2 - 1$$

$$\begin{aligned} h(x, y) &= f\left(x, y, \sqrt{x^2 - 1}\right) \\ &= x^2 + y^2 + (x^2 - 1) \\ &= 2x^2 + y^2 - 1 \end{aligned}$$

$h_x = 4x = 0$	$h_y = 2y = 0$
----------------	----------------

That is, at the point $(0, 0)$????

The domain of h is the entire xy -plane, the domain from which we can select the first two coordinates of the points (x, y, z) on the cylinder is restricted to the shadow of the cylinder on the xy -plane; it does not include the band between the lines $x = -1$ and $x = 1$.

$$x^2 - z^2 - 1 = 0 \rightarrow x^2 = z^2 + 1$$

$$\begin{aligned} k(y, z) &= f(z^2 + 1, y, z) \\ &= z^2 + 1 + y^2 + z^2 \\ &= y^2 + 2z^2 + 1 \end{aligned}$$

$k_y = 2y = 0$	$k_z = 4z = 0$
----------------	----------------

That implies to $y = z = 0$ and which leads to $x^2 = z^2 + 1 = 1 \rightarrow x = \pm 1$

The corresponding points on the cylinder are $(\pm 1, 0, 0)$.

$k(y, z) = y^2 + 2z^2 + 1 \geq 1$ gives a minimum value for k . We can also see that the minimum distance from the origin to a point on the cylinder is 1 unit.

Solution 2

Another way to find the points on the cylinder closet to the origin is to imagine a small sphere centered at the origin expanding until it touches the cylinder

$$f(x, y, z) = x^2 + y^2 + z^2 - a^2 \quad \text{and} \quad g(x, y, z) = x^2 - z^2 - 1$$

$$\nabla f = \lambda \nabla g$$

$$2x\hat{i} + 2y\hat{j} + 2z\hat{k} = \lambda(2x\hat{i} - 2z\hat{k})$$

$$\nabla f = f_x \hat{i} + f_y \hat{j} + f_z \hat{k} = \frac{d\vec{r}}{dt} + f_z \hat{k}$$

$$2x = 2\lambda x, \quad 2y = 0, \quad 2z = -2\lambda z$$

Since that no point on the surface has a zero x -coordinate to conclude that $x \neq 0$.

Hence, $2x = 2\lambda x$ only if

$$2 = 2\lambda \Rightarrow \boxed{\lambda = 1}$$

For $\lambda = 1 \rightarrow 2z = -2\lambda z = -2z$, for this to satisfies, z must be zero.

Also $2y = 0 \Rightarrow y = 0$

We conclude that the points have coordinates of the form $(x, 0, 0)$

$$x^2 = z^2 + 1 = 1 \rightarrow x = \pm 1$$

The points on the cylinder closet to the origin are the points $(\pm 1, 0, 0)$.

The Method of *Lagrange* Multipliers

The method of Lagrange multipliers:

$$\nabla f = \lambda \nabla g$$

For some scalar λ (called a ***Lagrange multiplier***)

Theorem – The orthogonal Gradient Theorem

Suppose that $f(x, y, z)$ is differentiable in a region whose interior contains a smooth curve

$$C: \vec{r}(t) = g(t)\hat{i} + h(t)\hat{j} + k(t)\hat{k}$$

If P_0 is a point on C where f has a local maximum or minimum relative to the values on C , then ∇f is orthogonal to C at P_0 .

Corollary

At the points on a smooth curve $\vec{r}(t) = g(t)\hat{i} + h(t)\hat{j}$ where differentiable function $f(x, y)$ takes on its local maxima and minima relative to its values on the curve, $\nabla f \cdot \vec{v} = 0$ where $\vec{v} = \frac{d\vec{r}}{dt}$.

The Method of Lagrange Multipliers

Suppose that $f(x, y, z)$ and $g(x, y, z)$ are differentiable and $\nabla g \neq 0$ when $g(x, y, z) = 0$. To find the local maximum and minimum values of f subject to the constraint $g(x, y, z) = 0$ (if these exist), find the values of x , y , z , and λ that simultaneously satisfy the equations

$$\nabla f = \lambda \nabla g \quad \text{and} \quad g(x, y, z) = 0$$

For functions of two independent variables, the condition is similar, but without the variables z .

Example

Find the greatest and smallest values that the function $f(x, y) = xy$ takes on the ellipse

$$\frac{x^2}{8} + \frac{y^2}{2} = 1$$

Solution

$f(x, y) = xy$ subject to the constraint

$$g(x, y) = \frac{x^2}{8} + \frac{y^2}{2} - 1 = 0$$

We need to find: $\nabla f = \lambda \nabla g$ and $g(x, y, z) = 0$

$$y\hat{i} + x\hat{j} = \frac{1}{4}\lambda x\hat{i} + \lambda y\hat{j} \qquad \nabla f = f_x\hat{i} + f_y\hat{j}$$

$$y = \frac{1}{4}\lambda x, \quad x = \lambda y$$

$$y = \frac{1}{4}\lambda(\lambda y) = \frac{1}{4}\lambda^2 y$$

$$y = 0 \quad \text{or} \quad 1 = \frac{1}{4}\lambda^2$$

$$\lambda^2 = 4 \Rightarrow \lambda = \pm 2$$

Consider these two cases:

Case 1: If $y = 0$, then $x = y = 0$. But $(0, 0)$ is not on the ellipse. Hence, $y \neq 0$.

Case 2: If $y \neq 0$, then $\lambda = \pm 2$ and $x = \pm 2y$.

$$g(x, y) = \frac{(\pm 2y)^2}{8} + \frac{y^2}{2} - 1 = 0$$

$$\frac{y^2}{2} + \frac{y^2}{2} = 1$$

$$y^2 = 1 \Rightarrow \boxed{y = \pm 1}$$

Therefore, $f(x, y) = xy$ takes on its extreme values on the ellipse at the points $(\pm 2, \pm 1)$.

The extreme values are $xy = 2$ and $xy = -2$

The Geometry of the solution: The level curves of the function $f(x, y) = xy$ are the hyperbolas $xy = c$

$$\text{At the point } (2, 1): \quad \nabla f = y\hat{i} + x\hat{j} = \hat{i} + 2\hat{j}, \quad \nabla g = \frac{1}{4}\lambda x\hat{i} + \lambda y\hat{j} = \frac{1}{2}\hat{i} + \hat{j}, \quad \nabla f = 2\nabla g$$

$$\text{At the point } (-2, -1): \quad \nabla f = \hat{i} - 2\hat{j}, \quad \nabla g = -\frac{1}{2}\hat{i} + \hat{j}, \quad \nabla f = -2\nabla g$$

Example

Find the maximum and minimum values that the function $f(x, y) = 3x + 4y$ on the circle $x^2 + y^2 = 1$

Solution

$$f(x, y) = 3x + 4y$$

$$g(x, y) = x^2 + y^2 - 1 = 0$$

$$\nabla f = f_x \hat{i} + f_y \hat{j} = 3\hat{i} + 4\hat{j}$$

$$\nabla g = 2x\hat{i} + 2y\hat{j}$$

$$\nabla f = \lambda \nabla g$$

$$3\hat{i} + 4\hat{j} = 2\lambda x\hat{i} + 2\lambda y\hat{j}$$

$$2\lambda x = 3, \quad 2\lambda y = 4$$

$$x = \frac{3}{2\lambda}, \quad y = \frac{2}{\lambda}$$

$$\left(\frac{3}{2\lambda}\right)^2 + \left(\frac{2}{\lambda}\right)^2 - 1 = 0$$

$$\frac{9}{4\lambda^2} + \frac{4}{\lambda^2} = 1$$

$$9 + 16 = 4\lambda^2$$

$$25 = 4\lambda^2$$

$$\lambda^2 = \frac{25}{4} \rightarrow \lambda = \pm \frac{5}{2}$$

$$x = \frac{3}{2\lambda} = \pm \frac{3}{5}, \quad y = \frac{2}{\lambda} = \pm \frac{4}{5}$$

Therefore, $f(x, y) = 3x + 4y$ has extreme values $\left(\pm \frac{3}{5}, \pm \frac{4}{5}\right)$

$$f\left(\frac{3}{5}, \frac{4}{5}\right) = 3\left(\frac{3}{5}\right) + 4\left(\frac{4}{5}\right) = 5$$

$$f\left(-\frac{3}{5}, -\frac{4}{5}\right) = 3\left(-\frac{3}{5}\right) + 4\left(-\frac{4}{5}\right) = -5$$

The Geometry of the solution:

The level curves of the function $f(x, y) = 3x + 4y$ are the lines $3x + 4y = c$

At the point $\left(\frac{3}{5}, \frac{4}{5}\right)$: $\nabla f = 3\hat{i} + 4\hat{j}$, $\nabla g = \frac{6}{5}\hat{i} + \frac{8}{5}\hat{j}$, $\nabla f = \frac{5}{2}\nabla g$

Lagrange Multipliers with Two Constraints

To find the extreme values of a differentiable function $f(x, y, z)$ whose variables are subject to two constraints. If the constraints are

$$g_1(x, y, z) = 0 \quad \text{and} \quad g_2(x, y, z) = 0$$

g_1 and g_2 are differentiable, with ∇g_1 not parallel to ∇g_2

$$\nabla f = \lambda \nabla g_1 + \mu \nabla g_2, \quad g_1(x, y, z) = 0, \quad g_2(x, y, z) = 0$$

Example

The plane $x + y + z = 1$ cuts the cylinder $x^2 + y^2 = 1$ in an ellipse.

Find the points on the ellipse that lie closest to and farthest from the origin.

Solution

$$f(x, y, z) = x^2 + y^2 + z^2$$

$$g_1(x, y, z) = x^2 + y^2 - 1 = 0$$

$$g_2(x, y, z) = x + y + z - 1 = 0$$

$$\nabla f = \lambda \nabla g_1 + \mu \nabla g_2$$

$$2x\hat{i} + 2y\hat{j} + 2z\hat{k} = \lambda(2x\hat{i} + 2y\hat{j}) + \mu(\hat{i} + \hat{j} + \hat{k})$$

$$2x\hat{i} + 2y\hat{j} + 2z\hat{k} = (2\lambda x + \mu)\hat{i} + (2\lambda y + \mu)\hat{j} + \mu\hat{k}$$

$2z = \mu$	$2x = 2\lambda x + \mu$ $2(1-\lambda)x = \mu = 2z$ $(1-\lambda)x = z$	$2y = 2\lambda y + \mu$ $2(1-\lambda)y = \mu = 2z$ $(1-\lambda)y = z$
------------	---	---

$$(1-\lambda)x = z = (1-\lambda)y$$

These satisfy if either $\lambda = 1$ and $z = 0$ or $\lambda \neq 1$ and $x = y = \frac{z}{1-\lambda}$

If $z = 0$,

$$\begin{cases} x^2 + y^2 - 1 = 0 \\ x + y - 1 = 0 \end{cases} \rightarrow x = 1 - y$$

$$(1-y)^2 + y^2 - 1 = 0$$

$$1 - 2y + y^2 + y^2 - 1 = 0$$

$$2y(y-1) = 0 \Rightarrow \begin{cases} y = 0 \rightarrow x = 1 \\ y = 1 \rightarrow x = 0 \end{cases}$$

The points are: $(1, 0, 0)$ and $(0, 1, 0)$

If $x = y$,

$x^2 + y^2 - 1 = 0$ $x^2 + x^2 - 1 = 0$ $2x^2 = 1$ $x^2 = \frac{1}{2}$	$x + y + z - 1 = 0$ $2x + z = 1$ $z = 1 - 2x$
$x = \pm \frac{1}{\sqrt{2}} = \pm \frac{\sqrt{2}}{2}$	$\begin{cases} x = -\frac{\sqrt{2}}{2} & \underline{z = 1 + \sqrt{2}} \\ x = \frac{\sqrt{2}}{2} & \underline{z = 1 - \sqrt{2}} \end{cases}$

The points are: $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 1 - \sqrt{2}\right)$ and $\left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}, 1 + \sqrt{2}\right)$

The points on the ellipse closest to the origin are $(1, 0, 0)$ and $(0, 1, 0)$. The point on the farthest from the origin is $\left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}, 1 + \sqrt{2}\right)$.

Exercises Section 2.8 – Lagrange Multipliers

1. Find the points on the ellipse $x^2 + 2y^2 = 1$ where $f(x, y) = xy$ has its extreme values.
2. Find the extreme values of $f(x, y) = xy$ subject to the constraint $g(x, y) = x^2 + y^2 - 10 = 0$.
3. Find the extreme values of $f(x, y) = x^3 + y^2$ on the circle $x^2 + y^2 = 1$
4. Find the extreme values of $f(x, y) = x^2 + y^2 - 3x - xy$ on the circle $x^2 + y^2 \leq 9$
5. Find the maximum value of $f(x, y) = 49 - x^2 - y^2$ on the line $x + 3y = 10$.
6. Find the points on the curve $x^2y = 2$ nearest the origin.
7. Use the method of Lagrange multipliers to find
 - a) The minimum value of $x + y$, subject to the constraints $xy = 16$, $x > 0$, $y > 0$
 - b) The maximum value of xy , subject to the constraints $x + y = 16$
8. Find the radius and height of the open right circular cylinder of largest surface area that can be inscribed in a sphere of radius a . What is the largest surface area?
9. Use the method of Lagrange multipliers to find the dimensions of the rectangle of greatest area that can be inscribed in the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$ with sides parallel to the coordinate axes.
10. Find the maximum and minimum values of $x^2 + y^2$ subject to the constraint $x^2 - 2x + y^2 - 4y = 0$
11. The temperature at a point (x, y) on a metal plate is $T(x, y) = 4x^2 - 4xy + y^2$. An ant on the plate walks around the circle of radius 5 centered at the origin. What are the highest and lowest temperatures encountered by the ant?
12. Your firm has been asked to design a storage tank for liquid petroleum gas. The customer's specifications call for a cylindrical tank with hemispherical ends, and the tank is to hold 8000 m^3 of gas. He customer also wants to use the smallest amount of material possible in building the tank. What radius and height do you recommend for the cylindrical portion of the tank?
13. A closed rectangular box is to have volume $V \text{ cm}^3$. The cost of the material used in the box is a $a \text{ cents / cm}^2$ for top and bottom, $b \text{ cents / cm}^2$ for front and back, and $c \text{ cents / cm}^2$ for the remaining sides. What dimensions minimize the total cost of materials?
14. Find the extreme values of $f(x, y, z) = x(y + z)$ on the curve of intersection of the right circular cylinder $x^2 + y^2 = 1$ and the hyperbolic cylinder $xz = 1$.

15. Find the point closest to the origin on the curve of intersection of the plane $x + y + z = 1$ and the cone $z^2 = 2x^2 + 2y^2$
16. Find the point on the plane $x + 2y + 3z = 13$ closest to the point $(1, 1, 1)$
17. Find the point on the sphere $x^2 + y^2 + z^2 = 4$ farthest from the point $(1, -1, 1)$
18. Find the minimum distance from the surface $x^2 - y^2 - z^2 = 1$ to the origin
19. Find the maximum and minimum values of $f(x, y, z) = x - 2y + 5z$ on the sphere $x^2 + y^2 + z^2 = 30$
20. Find three real numbers whose sum is 9 and the sum of whose squares is as small as possible.
21. A space probe in the shape of the ellipsoid $4x^2 + y^2 + 4z^2 = 16$ enters Earth's atmosphere and its surface begins to heat. After 1 hour, the temperature at the point (x, y, z) on the probe's surface is $T(x, y, z) = 8x^2 + 4yz - 16z + 600$.
Find the hottest point on the probe's surface.
22. What point on the plane $x + y + 4z = 8$ is closest to the origin? Give an argument showing you have found an absolute minimum of the distance function.
- (23 – 46) Use Lagrange multipliers to find the maximum and minimum values of f (when they exist) subject to the given constraint
23. $f(x, y) = 2x + y + 10$ subject to $2(x-1)^2 + 4(y-1)^2 = 1$
24. $f(x, y) = x^2 y^2$ subject to $2x^2 + y^2 = 1$
25. $f(x, y) = x + 2y$ subject to $x^2 + y^2 = 4$
26. $f(x, y) = xy^2$ subject to $x^2 + y^2 = 1$
27. $f(x, y) = x + y$ subject to $x^2 - xy + y^2 = 1$
28. $f(x, y) = x^2 + y^2$ subject to $2x^2 + 3xy + 2y^2 = 7$
29. $f(x, y) = xy$ subject to $x^2 + y^2 - xy = 9$
30. $f(x, y) = x - y$ subject to $x^2 - 3xy + y^2 = 20$
31. $f(x, y) = e^{2xy}$ subject to $x^2 + y^2 = 16$
32. $f(x, y) = x^2 + y^2$ subject to $x^6 + y^6 = 1$
33. $f(x, y) = y^2 - 4x^2$ subject to $x^2 + 2y^2 = 4$
34. $f(x, y) = xy + x + y$ subject to $x^2 y^2 = 4$

35. $f(x, y, z) = x + 3y - z$ subject to $x^2 + y^2 + z^2 = 4$
36. $f(x, y, z) = xyz$ subject to $x^2 + 2y^2 + 4z^2 = 9$
37. $f(x, y, z) = x$ subject to $x^2 + y^2 + z^2 - z = 1$
38. $f(x, y, z) = x - z$ subject to $x^2 + y^2 + z^2 - y = 2$
39. $f(x, y, z) = x^2 + y^2 + z^2$ subject to $x^2 + y^2 + z^2 - 4xy = 1$
40. $f(x, y, z) = x + y + z$ subject to $x^2 + y^2 + z^2 - 2x - 2y = 1$
41. $f(x, y, z) = 2x + z^2$ subject to $x^2 + y^2 + 2z^2 = 25$
42. $f(x, y, z) = x^2 + y^2 - z$ subject to $z = 2x^2y^2 + 1$
43. $f(x, y, z) = \sqrt{xyz}$ subject to $x + y + z = 1$ with $x \geq 0, y \geq 0, z \geq 0$
44. $f(x, y, z) = x^2 + y^2 + z^2$ subject to $x^2 + y^2 + z^2 - 4xy = 1$
45. $f(x, y, z) = x + 2y - z$ subject to $x^2 + y^2 + z^2 = 1$
46. $f(x, y, z) = x^2y^2z$ subject to $2x^2 + y^2 + z^2 = 25$
47. Use Lagrange multipliers to find the dimensions of the rectangle with the maximum perimeter that can be inscribed with sides parallel to the coordinate axes in the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.
48. Use Lagrange multipliers to find the dimensions of the right circular cylinder of minimum surface area (including the circular ends) with a volume of $32\pi \text{ in}^3$
49. Find the point(s) on the cone $z^2 - x^2 - y^2 = 0$ that are closest to the point $(1, 3, 1)$. Give an argument showing you have found an absolute minimum of the distance function.
50. Let $P_0(a, b, c)$ be a fixed point in \mathbb{R}^3 and let $d(x, y, z)$ be the distance between P_0 and a variable point $P(x, y, z)$.
- Compute $\nabla d(x, y, z)$
 - Show that $\nabla d(x, y, z)$ points in the direction from P_0 to P and has magnitude 1 for all (x, y, z) .
 - Describe the level surfaces of d and give the direction of $\nabla d(x, y, z)$ relative to the level surfaces of d .
 - Discuss $\lim_{P \rightarrow P_0} \nabla d(x, y, z)$

51. A shipping company requires that the sum of length plus girth of rectangular boxes must not exceed 108 in. Find the dimensions of the box with maximum volume that meets this condition. (the girth is the perimeter of the smallest base of the box).
52. Find the rectangular box with a volume of 16 ft^3 that has minimum surface area.
53. Find the minimum and maximum distances between the ellipse $x^2 + xy + y^2 = 1$ and the origin.
54. Find the dimensions of the rectangle of maximum area with sides parallel to the coordinate axes that can be inscribed in the ellipse $4x^2 + 16y^2 = 16$
55. Find the dimensions of the rectangle of maximum perimeter with sides parallel to the coordinate axes that can be inscribed in the ellipse $2x^2 + 4y^2 = 3$
56. Find the point on the plane $2x + 3y + 6z - 10 = 0$ closest to the point $(-2, 5, 1)$
57. Find the point on the surface $4x + y - 1 = 0$ closest to the point $(1, 2, -3)$
58. Find the points on the cone $z^2 = x^2 + y^2$ closest to the point $(1, 2, 0)$
59. Find the minimum and maximum distances between the sphere $x^2 + y^2 + z^2 = 9$ closest to the point $(2, 3, 4)$
60. Find the maximum value of $x_1 + x_2 + x_3 + x_4$ subject to $x_1^2 + x_2^2 + x_3^2 + x_4^2 = 16$
61. Find the maximum value of $x_1 + x_2 + \cdots + x_n$ subject to $x_1^2 + x_2^2 + \cdots + x_n^2 = c^2$
62. Find the maximum value of $a_1 x_1 + a_2 x_2 + \cdots + a_n x_n$ subject to $x_1^2 + x_2^2 + \cdots + x_n^2 = 1$ for the given positive real numbers a_1, a_2, \cdots, a_n
63. The planes $x + 2z = 12$ and $x + y = 6$ intersect in a line L . Find the point on L nearest the origin.
64. Find the maximum and minimum values of $f(x, y, z) = xyz$ subject to $x^2 + y^2 = 4$ and $x + y + z = 1$
65. The paraboloid $z = x^2 + 2y^2 + 1$ and the plane $x - y + 2z = 4$ intersect in a curve C . Find the points on C that have minimum and maximum distance from the origin.
66. Find the maximum and minimum values of $f(x, y, z) = x^2 + y^2 + z^2$ on the curve on which the cone $z^2 = 4x^2 + 4y^2$ and the plane $2x + 4z = 5$ intersect.

- 67.** The temperature of points on a elliptical plate $x^2 + y^2 + xy \leq 1$ is given by $T(x, y) = 25(x^2 + y^2)$. Find the hottest and coldest temperatures on the edge of the elliptical plate.
