

Prove that if  $A$  is an  $n \times n$  matrix, there is an invertible matrix  $C$  such that  $CA$  is in reduced row-echelon form. ①

The reduced row-echelon form of  $A$  can be written in the form  $E_n \dots E_1 A$ ,  $E_1, E_2, \dots, E_n$  are elementary matrices.

Let  $C = E_n \dots E_1$ , then  $C$  is invertible since  $E_1, \dots, E_n$  are invertible. Hence,  $\exists$  such a matrix  $C$ .

Prove that 2  $n \times n$  matrices  $A$  and  $B$  are row equivalent iff there exists a nonsingular matrix  $P$  such that  $B = PA$ .

Suppose that  $A \sim B$ . Then there exist elementary matrices  $E_1, E_2, \dots, E_n$  such that  $B = E_n \dots E_1 A$ .

Let  $P = E_n \dots E_1 \Rightarrow$  by the theorem,  $P$  is nonsingular. Suppose that  $B = PA$ , for some nonsingular matrix  $P$ . By theorem  $P$  is row equivalent to  $I_n$ . That is,  $I_n = E_n \dots E_1 P$ . Thus,  $B = E_1^{-1} E_2^{-1} \dots E_n^{-1} A$  and this implies that  $A$  is row equivalent to  $B$ .

Let  $A$  and  $B$  be 2  $n \times n$  matrices. Suppose  $A$  is row equivalent to  $B$ . Prove that  $A$  is nonsingular iff  $B$  is nonsingular.

Suppose that  $A$  is row equivalent to  $B$ . Then  $B = PA$  (Prove Above) w/  $P$  nonsingular. If  $A$  is nonsingular then  $B$  is nonsingular. Conversely, if  $B$  is nonsingular then  $A = P^{-1}B$  is nonsingular.

Show that a  $2 \times 2$  lower triangular matrix is invertible iff  $a_{11}, a_{22} \neq 0$  and in this case the inverse is also lower triangular.

The lower triangular matrix  $A = \begin{bmatrix} a_{11} & 0 \\ a_{21} & a_{22} \end{bmatrix}$

is invertible iff  $a_{11}, a_{22} \neq 0$  and then

$$A^{-1} = \begin{pmatrix} \frac{1}{a_{11}} & 0 \\ -\frac{a_{21}}{a_{11}a_{22}} & \frac{1}{a_{22}} \end{pmatrix}$$

Show that if  $A$  and  $B$  are two  $n \times n$  invertible matrices then  $A$  is row equivalent to  $B$

Since  $A$  is invertible, then (by theorem)  $A$  is row equivalent to  $I_n$ . That is, there exist elementary matrices  $E_1, \dots, E_k$

such that  $I_n = E_k E_{k-1} \dots E_1 A$ .

Similarly, there exist elementary matrices  $F_1, F_2, \dots, F_l$  such that  $I_n = F_l F_{l-1} \dots F_1 B$ .

Hence  $A = E_1^{-1} E_2^{-1} \dots E_k^{-1} F_l F_{l-1} \dots F_1 B$ . That is,  $A$  is row equivalent to  $B$ .

Prove that a square matrix  $A$  is nonsingular iff  $A$  is a product of elementary matrices.

Suppose that  $A$  is nonsingular. Then  $A$  is row equivalent to  $I_n$ . That is, there exist elementary matrices  $E_1, E_2, \dots, E_k$  such that  $I_n = E_k E_{k-1} \dots E_1 A$ . Then  $A = E_1^{-1} E_2^{-1} \dots E_k^{-1}$ .

But each  $E_i^{-1}$  is an elementary matrix.

Conversely, suppose that  $A = E_1 E_2 \dots E_k$ . Then  $(E_1 E_2 \dots E_k)^{-1} A = I_n$ . That is,  $A$  is nonsingular.

Show that if  $A \sim B$  (that is, if they are row equivalent), then  $EA = B$  for some matrix  $E$  which is a product of elementary matrices.

If  $A \sim B$ , there is some sequence of elementary row operations which, when performed on  $A$ , produce  $B$ . Further, multiplying on the left by the corresponding elementary matrix is the same as performing that row operation. So we have

$$A \sim E_1 A \sim E_2 E_1 A \sim \dots \sim E_k E_{k-1} \dots E_1 A = B$$

Thus, if  $E = E_k \dots E_1$  we have  $EA = B$

Show that if  $EA = B$  for some matrix  $E$  which is a product of elementary matrices, then  $AC \sim BC$  for every  $n \times n$  matrix  $C$

Let  $E = E_k E_{k-1} \dots E_1$ , where each  $E_i$  is an elementary matrix.

$$AC \sim E_1 AC \sim E_2 E_1 AC \sim \dots \sim E_k \dots E_2 E_1 AC = EAC$$

$$\text{Since } EA = B \Rightarrow CEA = CB$$

$$EAC = CB \Rightarrow AC \sim BC$$

Let  $A\vec{x} = \vec{0}$  be a homogeneous system of  $n$  linear equations in  $n$  unknowns that has only the trivial solution. Show that if  $k$  is any positive integer, then the system  $A^k \vec{x} = \vec{0}$  also has only trivial solution.

Since  $A$  is a square matrix, thus  $A$  has only the trivial soln  $\Rightarrow A$  is invertible. But  $A^k$  is also invertible so  $A^k \vec{x} = \vec{0}$  has only trivial soln.

Let  $A\vec{x} = \vec{0}$  be a homogeneous system of  $n$  linear eqns. in  $n$  unknowns, and let  $Q$  be an invertible  $n \times n$  matrix. Show that  $A\vec{x} = \vec{0}$  has just trivial solution if and only if  $(QA)\vec{x} = \vec{0}$  has just trivial solution.

$A$  is an  $n \times n$  matrix. If  $A\vec{x} = \vec{0}$  has just trivial soln, then  $A$  is invertible. Since  $Q$  is an invertible  $n \times n$  matrix  $\Rightarrow QA$  is also invertible.

Thus  $(QA)\vec{x} = \vec{0}$  has trivial soln.

On the other hand, if  $(QA)\vec{x} = \vec{0}$  has trivial soln  $\Rightarrow QA$  is invertible.

Since  $Q$  is invertible  $\Rightarrow Q^{-1}$  is also invertible.

Thus  $A = Q^{-1}QA$  is invertible i.e.  $A\vec{x} = \vec{0}$  has just trivial soln.

$\Rightarrow A\vec{x} = \vec{0}$  has just trivial soln iff  $(QA)\vec{x} = \vec{0}$  has just trivial soln.

Let  $A\vec{x} = \vec{b}$  be any consistent system of linear eqns, and let  $\vec{x}_1$  be a fixed soln. Show that every soln. to the system can be written in the form  $\vec{x} = \vec{x}_1 + \vec{x}_0$  where  $\vec{x}_0$  is a solution to  $A\vec{x} = \vec{0}$ . Show also that every matrix of this form is a solution.

Since  $\vec{x}_0$  is a solution to  $A\vec{x} = \vec{0}$ , we have  $A\vec{x}_0 = \vec{0}$ .

Adding  $A\vec{x}_0 = \vec{0}$  to  $A\vec{x} = \vec{b} \Rightarrow A\vec{x} + A\vec{x}_0 = \vec{b} + \vec{0}$

$$A(\vec{x} + \vec{x}_0) = \vec{b}$$

As adding an eqn to the original eqn does not affect the soln, if we let  $\vec{x}_1$  be a fixed solution, then every soln to  $A\vec{x} = \vec{b}$  is  $\vec{x} = \vec{x}_1 + \vec{x}_0$ .

Besides  $A(\vec{x}_1 + \vec{x}_0) = A\vec{x}_1 + A\vec{x}_0 = \vec{b} + \vec{0} = \vec{b}$

So every matrix (vector) in the form  $\vec{x}_1 + \vec{x}_0$  is a solution to  $A\vec{x} = \vec{b}$ .
