### Exercise

Find at least three different sequences beginning with the terms 1, 2, 4 whose terms are generated by a simple formula or rule.

#### Solution

$$1. \ 2^{n-1} \rightarrow 1, 2, 4, 8, 16, \dots$$

2. The second pattern,  $2 - 1 = 1$   $4 - 2 = 2$ , as we see the difference to the previous increasing by value of 1. So the next term  $4 + 3 = 7$   $7 + 4 = 11$ .

Therefore the sequence is 1, 2, 4, 7, 11, 16, ...

3. 1, 2, 4, 1, 2, 4, ... Repeating the terms

g)  $a_n = (-4)^n$ ?

h)  $a_n = n^2 4^n$ ?

### Solution

a) Let  $a_n = 8a_{n-1} - 16a_{n-2} = 0$  We get  $0 = 0$  which is a true statement.

$\therefore a_n = 0$  is a solution of the recurrence relation.

b) Let  $a_n = 8a_{n-1} - 16a_{n-2} = 1$  We get  $1 = 8 \cdot 1 - 16 \cdot 1 = -8$  which is a false statement.

$\therefore a_n = 1$  is not a solution.

c) Let  $a_n = 8a_{n-1} - 16a_{n-2} = 2^n$  We get  $2^n = 8 \cdot 2^{n-1} - 16 \cdot 2^{n-2} = 2^{n-2}(8 \cdot 2 - 16) = 0$  which is a false statement.  $\therefore a_n = 1$  is not a solution.

d) Let  $a_n = 8a_{n-1} - 16a_{n-2} = 4^n$  We get

$$\begin{aligned} 4^n &= 8 \cdot 4^{n-1} - 16 \cdot 4^{n-2} \\ &= 4^{n-2}(8 \cdot 4 - 16) \\ &= 4^{n-2} \cdot (16) \\ &= 4^{n-2} \cdot 4^2 \\ &= 4^n \text{ which is a true statement} \end{aligned}$$

$\therefore a_n = 4^n$  is a solution of the recurrence relation.

e) Let  $a_n = 8a_{n-1} - 16a_{n-2} = n4^n$  We get

$$\begin{aligned} n4^n &= 8 \cdot n4^{n-1} - 16 \cdot n4^{n-2} \\ &= n4^{n-2}(8 \cdot 4 - 16) \\ &= n4^{n-2} \cdot (4^2) \end{aligned}$$

$= n4^n$  which is a true statement

$\therefore a_n = n4^n$  is a solution of the recurrence relation.

f) Let  $a_n = 8a_{n-1} - 16a_{n-2} = 2 \cdot 4^n + 3n4^n$  We get

$$\begin{aligned} 2 \cdot 4^n + 3n4^n &= 8 \cdot (2 \cdot 4^{n-1} + 3(n-1)4^{n-1}) - 16 \cdot (2 \cdot 4^{n-2} + 3(n-2)4^{n-2}) \\ &= 8 \cdot 4^{n-2} (2 \cdot 4 + 3 \cdot 4(n-1) - 2 \cdot (2 + 3(n-2))) \\ &= 8 \cdot 4^{n-2} (8 + 12n - 12 - 4 - 6n + 12) \\ &= 8 \cdot 4^{n-2} (4 + 6n) \\ &= 4^2 4^{n-2} (2 + 3n) \\ &= 2 \cdot 4^n + 3n \cdot 4^n \text{ which is a true statement} \end{aligned}$$

$\therefore a_n = 2 \cdot 4^n + 3n \cdot 4^n$  is a solution of the recurrence relation.

g) Let  $a_n = 8a_{n-1} - 16a_{n-2} = (-4)^n$  We get

$$\begin{aligned} (-4)^n &= 8 \cdot (-4)^{n-1} - 16 \cdot (-4)^{n-2} \\ &= (-4)^{n-2} (8 \cdot (-4) - 16) \\ &= (-4)^{n-2} (-48) \\ &= (-4)^{n-2} (-16 \cdot 3) \\ &= (-4)^{n-2} (-4)^2 \cdot 3 \\ &= (-4)^n \cdot 3 \text{ which is a false statement} \end{aligned}$$

$\therefore a_n = 4^n$  is not a solution.

h) Let  $a_n = 8a_{n-1} - 16a_{n-2} = n^2 4^n$  We get

$$\begin{aligned} n^2 4^n &= 8 \cdot (n-1)^2 4^{n-1} - 16 \cdot (n-2)^2 4^{n-2} \\ &= 8 \cdot 4^{n-2} ((n^2 - 2n + 1) \cdot 4 - 2 \cdot (n^2 - 4n + 4)) \\ &= 16 \cdot 4^{n-2} (2n^2 - 4n + 2 - n^2 + 4n - 4) \\ &= 4^n (n^2 - 2) \\ &= n4^n \text{ which is a false statement} \end{aligned}$$

### Exercise

A person deposits \$1,000.00 in an account that yields 9% interest compounded annually.

- Set up a recurrence relation for the amount in the account at the end of  $n$  years.
- Find an explicit formula for the amount in the account at the end of  $n$  years.
- How much money will the account contain after 100 years?

### Solution

- The amount after  $n-1$  years multiplied by 1.09 to give the amount after  $n$  years, since 9% of the value must be added to account for the interest. Therefore, we have  $a_n = 1.09a_{n-1}$ . The initial condition is  $a_0 = 1000$ .
- Since multiplying by 1.09 for each year, the solution is  $a_n = 1000(1.09)^n$ .
- $a_{100} = 1000(1.09)^{100} \approx \underline{\$5,529,041}$

### Exercise

Suppose that the number of bacteria in a colony triples every hour.

- Set up a recurrence relation for the number of bacteria after  $n$  hours have elapsed.
- If 100 bacteria are used to begin new colony, how many bacteria will be in the colony in 10 hours?

### Solution

- Since the number of bacteria triples every hour, the recurrence relation should say that the number of bacteria after  $n$  hours is 3 times the number of bacteria after  $n-1$  hours. Let  $a_n$  denote the number of bacteria after  $n$  hours, this statement translates into the recurrence relation  $a_n = 3a_{n-1}$
- The initial condition is  $a_0 = 100$ .  

$$a_n = 3 \cdot a_{n-1} = 3^2 \cdot a_{n-2} = \cdots = 3^n \cdot a_0$$

$$n = 10 \rightarrow \underline{a_{10}} = 100 \cdot 3^{10} = \underline{5,904,900}$$

### Exercise

A factory makes custom sports cars at an increasing rate. In the first month only one car is made, in the second month two cars are made, and so on, with  $n$  cars made in the  $n$ th month.

- Set up a recurrence relation for the number of cars produced in the first  $n$  months by this factory.
- How many cars are produced in the first year?
- Find an explicit formula for the number of cars produced in the first  $n$  months by this factory

### Solution

- a) Let  $c_n$  be the number of cars produced in the first  $n$  months. The initial condition is  $c_0 = 0$ .

Since  $n$  cars are made in the  $n$ th month then  $c_n = c_{n-1} + n$ , where  $c_{n-1}$  is the first  $n-1$  months

- b) The number of cars produced in the first year is  $c_{12}$ . Plug in  $n = 12$ , we get

$$\begin{aligned}c_n &= n + c_{n-1} \\&= n + (n-1) + c_{n-2} \\&= n + (n-1) + (n-2) + c_{n-3} \\&\vdots \\&= n + (n-1) + (n-2) + \cdots + 1 + c_0 \\&= \frac{n(n+1)}{2} + 0 \\&= \frac{n^2 + n}{2} \\c_{12} &= \frac{12^2 + 12}{2} = 78\end{aligned}$$

c)  $c_n = \frac{n^2 + n}{2}$

### Solution

- a) We have one 1 and one 0, then two 1 and two 0, then three of each, and so on increasing the repetition by one each time. Since we have only one at the end, then we need three 1 and four 0 to continue the sequence.
- b) A pattern is that the positive integers are increasing order, with odd number showing once and each even number repeated. Thus the next terms are 9, 10, 10.
- c) The terms in the odd locations are the successive terms in the geometric sequence that starts with 1 and has ratio 2, and the terms in the even locations are all 0. The  $n$ th term is 0 if  $n$  even and is  $2^{(n-1)/2}$  if  $n$  is odd. Thus the next three terms are 32, 0, 64.
- d) The first term is 3 and each successive term is twice the predecessor. The  $n$ th term is  $3 \cdot 2^{n-1}$   $n > 0$ . Thus the next three terms are 384, 768, 1536.
- e) The first term is 15 and each successive term is 7 less than its predecessor. The  $n$ th term is  $15 - 7(n-1) = 22 - 7n$ . Thus the next three terms are -34, -41, -48.
- f) The first term is 3 and each successive term by adding  $n$  to its predecessor.  
 3,  $3 + 2$ ,  $5 + 3$ ,  $8 + 4$ ,  $12 + 5$   $n$ th  $3 + 2 + 3 + 4 + 5 + \dots + n = 2 + 1 + 2 + 3 + 4 + 5 + \dots + n$   

$$= 2 + \frac{n^2 + n}{2}$$
  
 The  $n$ th term is  $\frac{1}{2}(n^2 + n + 4)$ . Thus the next three terms are 57, 68, 80.
- g) Since all numbers are even, then if we divide by 2 the sequence becomes: 1, 8, 27, 64, 125, 216, 343, .... This sequence appears to be  $n^3$ , therefore the  $n$ th term is  $2n^3$ . Thus the next three terms are 1024, 1458, 2000.
- h) The  $n$ th term appears to be  $n! + 1$ . Thus the next three terms are 362881, 3628801, 39916801.
- i) The first term is 3 then by adding 3 to the predecessor, then 5, then 7, and so on.  
 3,  $3 + 3$ ,  $6 + 5$ ,  $11 + 7$ , ...  $\rightarrow 1 + 2$ ,  $4 + 2$ ,  $9 + 2$ ,  $16 + 2$ , ...  
 Then the  $n$ th term is  $n^2 + 2$ . Thus the next three terms are 123, 146, 171.
- j) This an arithmetic sequence whose difference is 4. Thus the  $n$ th term is  $7 + 4(n-1) = 4n + 3$ . Thus the next three terms are 47, 51, 55.
- k) This is a binary expansion of  $n$ . Thus the next three terms are 1100, 1101, 1110.
