The base of the solid is the disk  $x^2 + y^2 \leq 1$ . The cross-sections by planes perpendicular to the  $y$ -axis between  $y = -1$  and  $y = 1$  are isosceles right triangles with one leg in the disk.

### Solution

$$x^2 + y^2 = 1 \rightarrow x^2 = 1 - y^2 \Rightarrow \boxed{x = \pm\sqrt{1 - y^2}}$$

$$\begin{aligned} A(y) &= \frac{1}{2}(\text{leg})(\text{leg}) = \frac{1}{2} \left[ \sqrt{1 - y^2} - \left( -\sqrt{1 - y^2} \right) \right]^2 \\ &= \frac{1}{2} \left[ 2\sqrt{1 - y^2} \right]^2 \\ &= \underline{2(1 - y^2) \text{ unit}^2} \quad c = -1, \quad d = 1; \end{aligned}$$

### Exercise

Find the volume of the given tetrahedron. (**Hint:** Consider slices perpendicular to one of the labeled edges)

### Solution

Let consider the slices perpendicular to edge labeled 5 are triangles.

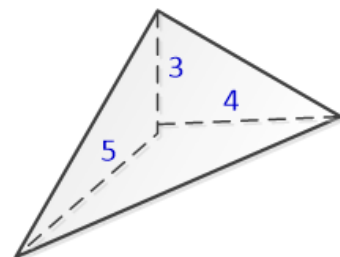

By similar triangles, we have:  $\frac{\text{height}}{\text{base}} = \frac{h}{b} = \frac{3}{4} \Rightarrow h = \frac{3}{4}b$

The equation of the line through  $(5, 0)$  and  $(0, 4)$  is:  $y = \frac{4-0}{0-5}(x-0) + 4 \rightarrow y = -\frac{4}{5}x + 4$

Therefore, the length of the base:  $b = -\frac{4}{5}x + 4$

$$h = \frac{3}{4}b = \frac{3}{4} \left( -\frac{4}{5}x + 4 \right) = -\frac{3}{5}x + 3$$

$$\begin{aligned} A(x) &= \frac{1}{2}(\text{base}) \cdot (\text{height}) = \frac{1}{2} \left( -\frac{4}{5}x + 4 \right) \left( -\frac{3}{5}x + 3 \right) \\ &= \frac{1}{2} \left( \frac{12}{25}x^2 - \frac{24}{5}x + 12 \right) \end{aligned}$$

$$= \frac{6}{25}x^2 - \frac{12}{5}x + 5 \text{ unit}^2$$

$$V = \int_0^5 \left( \frac{6}{25}x^2 - \frac{12}{5}x + 5 \right) dx$$

$$= \left[ \frac{2}{25}x^3 - \frac{6}{5}x^2 + 5x \right]_0^5$$

$$= \left[ \frac{2}{25}(5)^3 - \frac{6}{5}(5)^2 + 5(5) \right]$$

$$= 10 \text{ unit}^3$$

### Exercise

A curved wedge is cut from a circular cylinder of radius 3 by two planes. One plane is perpendicular to the axis of the cylinder. The second plane crosses the first plane at a  $45^\circ$  angle at the center of the cylinder. Find the volume of the wedge.

### Solution

The base of the cylinder is a circle  $x^2 + y^2 = 9$ .

Since the second plane cut the base at the cylinder at the center, therefore, the base of the wedge is semi-circle.  $y = \pm\sqrt{9 - x^2} = \text{radius}$ .

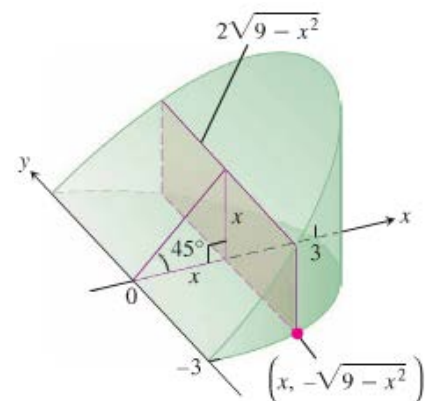

When we slice the wedge by a plane perpendicular to the axis of the cylinder, we obtained a cross-section at  $x$  which is a rectangle of height  $x$ .

The area of this cross-section is:  $A(x) = \text{height} \times \text{width}$

$$\begin{aligned}
 &= x \left( 2\sqrt{9 - x^2} \right) \\
 &= 2x\sqrt{9 - x^2}
 \end{aligned}$$

The rectangles run from  $x = 0$  to  $x = 3$ , so

$$\begin{aligned}
 V &= \int_0^3 2x\sqrt{9 - x^2} dx \quad \text{or } u = 9 - x^2 \rightarrow du = -2xdx \\
 &= - \int_0^3 (9 - x^2)^{1/2} d(9 - x^2) \\
 &= -\frac{2}{3} \left[ (9 - x^2)^{3/2} \right]_0^3 \\

$$\begin{aligned} V &= \int_0^h (\pi r^2) dz \\ &= \pi r^2 z \Big|_0^h \\ &= \pi r^2 h \text{ unit}^3 \end{aligned}$$

## Exercise

Find the volume of the solid of intersection (the solid common to both) of the two right circular cylinders of radius  $r$  whose axes meet at right angles.

Two intersecting cylinders

Solid of intersection

## Solution

The cross sections are squares.

By symmetry, we can divide the volume to 8 equal sections.

$$x^2 + y^2 = r^2 \rightarrow x = \sqrt{r^2 - y^2}$$

$$A = b^2 = \left( \sqrt{r^2 - y^2} \right)^2 = r^2 - y^2$$

$$V = 8 \int_0^r (r^2 - y^2) dy$$

$$= 8 \left( r^2 y - \frac{1}{3} y^3 \right) \Big|_0^r$$

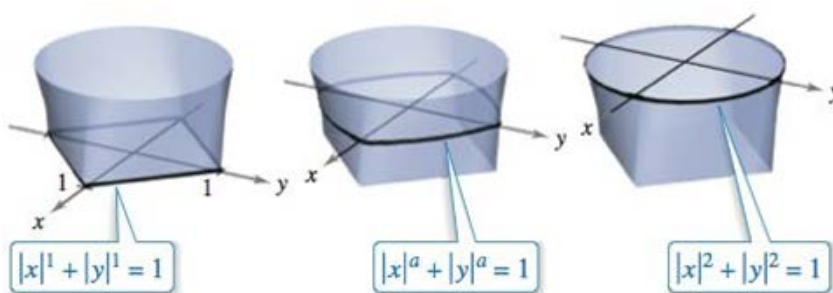

$$= 8 \left( r^3 - \frac{1}{3} r^3 \right)$$

$$= \frac{16}{3} r^3$$

### Exercise

The solid shown in the figure has cross sections bounded by the graph  $|x|^a + |y|^a = 1$  where  $1 \leq a \leq 2$ .

- Describe the cross section when  $a = 1$  and  $a = 2$ .
- Describe a procedure for approximating the volume of the solid.

### Solution

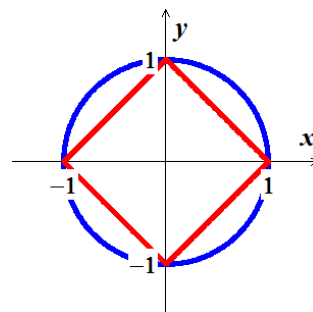

- When  $a = 1 \Rightarrow |x| + |y| = 1$  represents a square.

When  $a = 2 \Rightarrow |x|^2 + |y|^2 = 1$  represents a circle.

- $|x|^a + |y|^a = 1 \rightarrow |y| = (1 - |x|^a)^{1/a}$

$$A = 2 \int_{-1}^1 (1 - |x|^a)^{1/a} dx$$

$$= 4 \int_0^1 (1 - |x|^a)^{1/a} dx$$

To approximate the volume of the solid, from  $n$  slices, each of whose area is approximated by the integral above,

Then sum the volumes of these  $n$  slices.

### Exercise

Two planes cut a right circular cylinder to form a wedge. One plane is perpendicular to the axis of the cylinder and the second makes an angle of  $\theta$  degrees with the first.

- Find the volume of the wedge if  $\theta = 45^\circ$ .
- Find the volume of the wedge for an arbitrary angle  $\theta$ . Assuming that the cylinder has sufficient length, how does the volume of the wedge change as  $\theta$  increases from  $0^\circ$  to  $90^\circ$ ?

### Solution

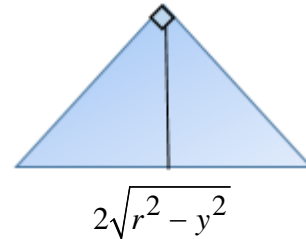

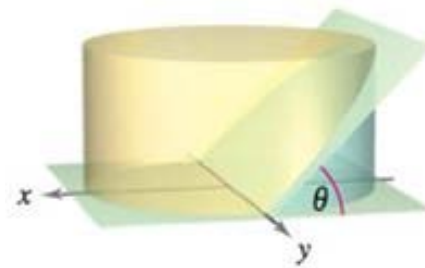

- Since  $\theta = 45^\circ$ , then the cross sections are isosceles right triangles.

$$x^2 + y^2 = r^2 \rightarrow x = \pm\sqrt{r^2 - y^2}$$

$$\tan 45^\circ = \frac{h}{\sqrt{r^2 - y^2}} = 1 \rightarrow h = \sqrt{r^2 - y^2}$$

$$\begin{aligned} A(y) &= \frac{1}{2}bh = \frac{1}{2}\sqrt{r^2 - y^2}\sqrt{r^2 - y^2} \\ &= \frac{1}{2}(r^2 - y^2) \end{aligned}$$

$$\begin{aligned} V &= \frac{1}{2} \int_{-r}^r (r^2 - y^2) dy \\ &= \left( r^2 y - \frac{1}{3} y^3 \right) \Big|_0^r \\ &= \frac{2}{3} r^3 \end{aligned}$$

- $\tan \theta = \frac{h}{\sqrt{r^2 - y^2}} \rightarrow h = (\tan \theta) \sqrt{r^2 - y^2}$

$$A(y) = \frac{1}{2}bh = \frac{1}{2}(r^2 - y^2) \tan \theta$$

$$\begin{aligned} V &= \frac{1}{2} \tan \theta \int_{-r}^r (r^2 - y^2) dy \\ &= \tan \theta \left( r^2 y - \frac{1}{3} y^3 \right) \Big|_0^r \\ &= \frac{2}{3} r^3 \tan \theta \end{aligned}$$

$$\text{As } \theta \rightarrow 90^\circ \Rightarrow V \rightarrow \infty$$

- a) Show that the volume of the torus is given by the integral

$$8\pi R \int_0^r \sqrt{r^2 - y^2} dy \quad \text{where } R > r > 0$$

- b) Find the volume of the torus

### Solution

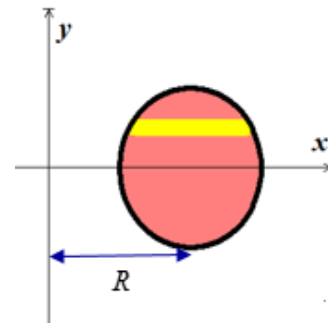

a)  $(x - R)^2 + y^2 = r^2 \rightarrow x = R \pm \sqrt{r^2 - y^2}$

$$\begin{aligned} V &= \pi \int_{-r}^r \left[ \left( R + \sqrt{r^2 - y^2} \right)^2 - \left( R - \sqrt{r^2 - y^2} \right)^2 \right] dy \\ &= 2\pi \int_0^r \left[ R^2 + 2R\sqrt{r^2 - y^2} + r^2 - y^2 - R^2 + 2R\sqrt{r^2 - y^2} - r^2 + y^2 \right] dy \\ &= 8\pi R \int_0^r \sqrt{r^2 - y^2} dy \quad \checkmark \end{aligned}$$

b)  $\int_0^r \sqrt{r^2 - y^2} dy$  is  $\frac{1}{4}$  of the area of a circle of radius  $r$ .

$$A = \frac{1}{4} \pi r^2$$

$$\begin{aligned} V &= 8\pi R \int_0^r \sqrt{r^2 - y^2} dy \\ &= 8\pi R \left( \frac{1}{4} \pi r^2 \right) \\ &= \underline{2\pi^2 r^2 R} \end{aligned}$$

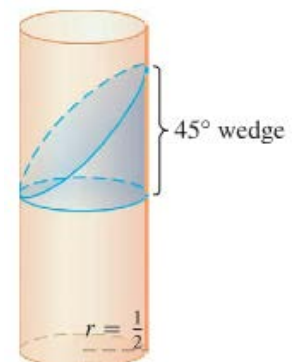

### Exercise

Consider a right-circular cylinder of diameter 1. Form a wedge by making one slice parallel to the base of the cylinder completely through the cylinder, and another slice at an angle of  $45^\circ$  to the first slice and intersecting the first slice at the opposite edge of the cylinder.

Find the volume of the wedge.

### Solution

Since the slice at an angle of  $45^\circ$ , the volume of the wedge is half of the cylinder of radius 0.5 and height 1.

$$V = \frac{1}{2} \pi \left( \frac{1}{2} \right)^2 (1)$$

$$= \frac{\pi}{8}$$

### Exercise

A martini glass in the shape of a right-circular cone of height  $h$  and semi-vertical angle  $\alpha$  is filled with liquid. Slowly a ball is lowered into the glass, displacing liquid and causing it to overflow. Find the radius  $R$  of the ball that causes the greatest volume of liquid to overflow out the glass.

### Solution

Let  $x$ : the distance of the center above the glass top.

$$\sin \alpha = \frac{R}{x+h} \Rightarrow R = (x+h) \sin \alpha$$

$$y^2 = R^2 - x^2$$

$$V = \pi \int_x^R (R^2 - x^2) dx$$

$$= \pi \left( R^2 x - \frac{1}{3} x^3 \right) \Big|_x^R$$

$$= \pi \left( R^3 - \frac{1}{3} R^3 - \left( R^2 x - \frac{1}{3} x^3 \right) \right)$$

$$= \pi \left( \frac{2}{3} R^3 - R^2 x + \frac{1}{3} x^3 \right)$$

$$= \frac{\pi}{3} (2R^3 - 3R^2 x + x^3)$$

$$\frac{dV}{dx} = \frac{\pi}{3} \left( 6R^2 \frac{dR}{dx} - 6Rx \frac{dR}{dx} - 3R^2 + 3x^2 \right) = 0$$

$$(6R^2 - 6Rx) \frac{dR}{dx} - 3R^2 + 3x^2 = 0$$

$$6R(R-x) \frac{dR}{dx} = 3(R^2 - x^2)$$

$$2R(R-x) \frac{dR}{dx} = (R-x)(R+x)$$

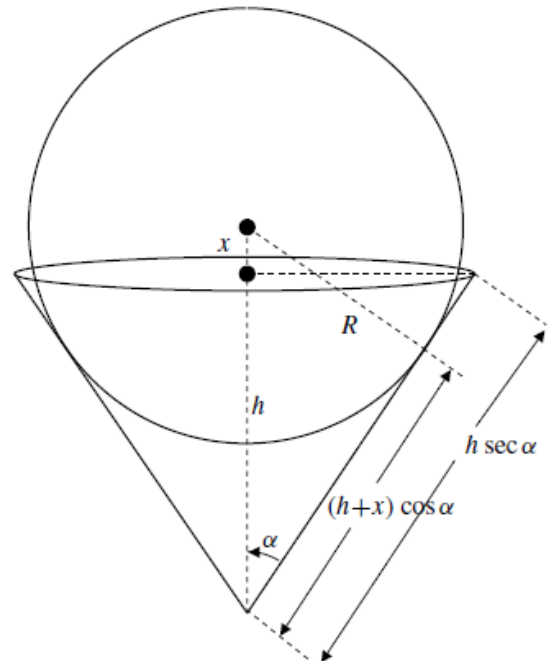

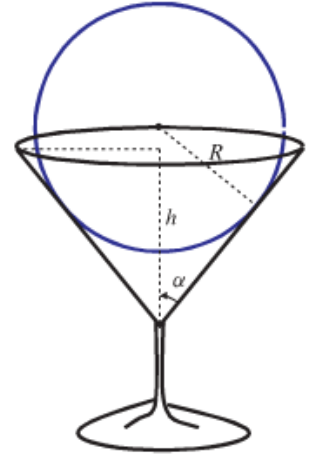

$$2R \frac{dR}{dx} = R+x$$

$$R = x \sin \alpha + h \sin \alpha \Rightarrow \frac{dR}{dx} = \sin \alpha$$

$$2R \sin \alpha = R + \frac{R}{\sin \alpha} - h$$

$$R + \frac{R}{\sin \alpha} - 2R \sin \alpha = h$$

$$R(\sin \alpha + 1 - 2 \sin^2 \alpha) = h \sin \alpha$$

$$R = \frac{h \sin \alpha}{\sin \alpha + 1 - 2 \sin^2 \alpha}$$

$$R = \frac{h \sin \alpha}{\sin \alpha + \cos 2\alpha} \leq h \frac{\sin^2 \alpha}{\cos^2 \alpha}$$

$$x = \frac{1}{\sin \alpha} R - h$$

$$= \frac{1}{\sin \alpha} \frac{h \sin \alpha}{\sin \alpha + 1 - 2 \sin^2 \alpha} - h$$

$$= h \left( \frac{1}{\sin \alpha + 1 - 2 \sin^2 \alpha} - 1 \right)$$

$$= h \left( \frac{2 \sin^2 \alpha - \sin \alpha}{\sin \alpha + 1 - 2 \sin^2 \alpha} \right)$$

$$-R \leq x = h \left( \frac{2 \sin^2 \alpha - \sin \alpha}{\sin \alpha + 1 - 2 \sin^2 \alpha} \right) \leq R \leq h \tan^2 \alpha$$
