Lecture Seven –Trigonometric Graphs

Section 7.1 – Graphing Sine & Cosine

We consider graphs of the equation: $y = A\sin(Bx + C) + D \quad y = A\cos(Bx + C) + D$

Amplitude

If the greatest value of y is M and the least value of $\boldsymbol{y}$ is m, then the amplitude of the graph of y is defined to be

$$A = \frac{1}{2}|M - m|$$

The amplitude is $|A|$.

Note: If $A > 0$, then the graph of $y = A\sin x$ and $y = A\cos x$ will have amplitude A and range $[-A, A]$.

Period

$$\rightarrow Period = \frac{2\pi}{|B|}$$

Many things in daily life repeat with a predictable pattern, such as weather, tides, and hours of daylight.

This periodic graph represents a normal heartbeat.

Example

Find the amplitude and the period of $y = 3\sin 2x$

Solution

Amplitude: $|A| = |3|$

$= 3$

Period: $P = \frac{2\pi}{2}$ $\qquad\qquad P = \frac{2\pi}{|B|}$

$= \pi$

Example

Find the amplitude and the period of $y = 2\sin\frac{1}{2}x$

Solution

Amplitude: $|A| = |2|$

$= 2$

Period: $P = \dfrac{2\pi}{\frac{1}{2}}$ $\qquad P = \dfrac{2\pi}{|B|}$

$= 4\pi$

Example

Find the amplitude and the period of $y = -4\sin(-\pi x)$

Solution

Amplitude: $|A| = |-4|$

$= 4$

Period: $P = \dfrac{2\pi}{\pi}$ $\qquad P = \dfrac{2\pi}{|B|}$

$= 2$

Even and *Odd* Functions

Definition

An *even function* is a function for which $f(-x) = f(x)$

An *odd function* is a function for which $f(-x) = -f(x)$

Even Functions	***Odd Functions***
$y = \cos\theta$, $y = \sec\theta$	$y = \sin\theta$, $y = \csc\theta$ $y = \tan\theta$, $y = \cot\theta$
Graphs are symmetric about the y-axis	*Graphs are symmetric about the origin*

Phase shift

If we add a term to the argument of the function, the graph will be translated in a ***horizontal direction***.

In the function $y = f\left(x - c\right)$, the expression $x - c$ is called the ***argument***.

$$\boxed{Phase\ Shift:\quad \phi = -\frac{C}{B}}$$

Example

Find the amplitude, the period, and the phase shift of $y = 3\sin\left(2x + \frac{\pi}{2}\right)$

Solution

Amplitude: $\left|A\right| = 3$

Period: $P = \frac{2\pi}{2}$ $\qquad P = \frac{2\pi}{\left|B\right|}$

$= \pi$

Phase shift: $\phi = -\frac{\pi}{2}\frac{1}{2}$ $\qquad \phi = -\frac{C}{B}$

$= -\frac{\pi}{4}$

Vertical **Translations**

For $d > 0$, $\quad y = f(x) + d \Rightarrow$ The graph shifted up d units

$y = f(x) - d \Rightarrow$ The graph shifted down d units

Example

Find the amplitude, the period, and the vertical shift of $y = -3 - 2\sin \pi x$

Amplitude: $A = 2$

Period: $P = \frac{2\pi}{\pi} = 2$

Vertical Shifting: $y = -3$ $\qquad$ *Down 3 units*

If the radio station is broadcasting at a wavelength λ and the distance between the two radio towers is equal to $\frac{1}{2}\lambda$, then the intensity I of the signal in the direction θ is given by

Vertical Asymptote

A ***vertical asymptote*** is a vertical line that the graph approaches but does not intersect, while function values increase or decrease without bound as x-values get closer and closer to the line.

Graphing the *Tangent* Functions

The graphs of $y = A\tan(Bx + C) + D$ will have the following characteristics:

Domain: $\left\{x \mid x \neq (2n+1)\frac{\pi}{2},\ where\ n \in \mathbb{Z}\right\}$

- The graph is discontinuous at values of x of the form $x = (2n+1)\frac{\pi}{2}$ and has ***vertical asymptotes*** at these values.
- Its ***x-intercepts*** are of the form $x = n\pi$.
- Its period is π.
- Its graph has no amplitude, since there are no minimum or maximum values.
- The graph is symmetric with respect to the origin, so the function is an odd function. For all x in the domain, $\tan(-x) = -\tan(x)$.

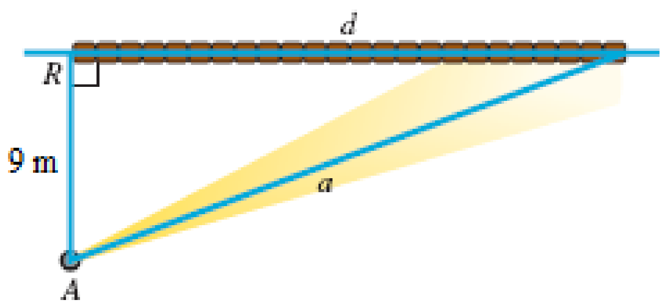
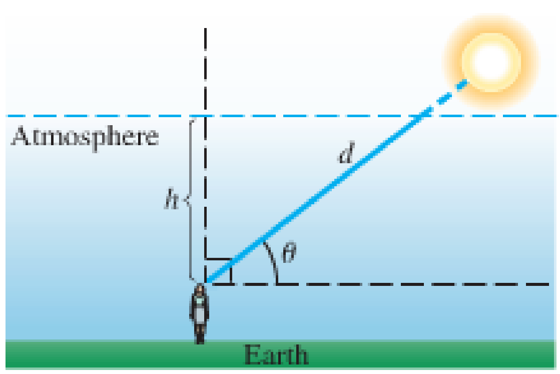
14. A rotating beacon is located at point A next to a long wall. The beacon is 9 m from the wall. The distance $\boldsymbol{a}$ is given by $a = 9\left|\sec 2\pi t\right|$, where t is time measured in seconds since the beacon started rotating. (When $t = 0$, the beacon is aimed at point R.) Find $\boldsymbol{a}$ for $t = 0.45$



15. The shortest path for the sun's rays through Earth's atmosphere occurs when the sun is directly overhead. Disregarding the curvature of Earth, as the sun moves lower on the horizon, the distance that sunlight passes through the atmosphere increases by a factor of $\csc\theta$, where θ is the angle of elevation of the sun. This increased distance reduces both the intensity of the sun and the amount of ultraviolet light that reached Earth's surface.

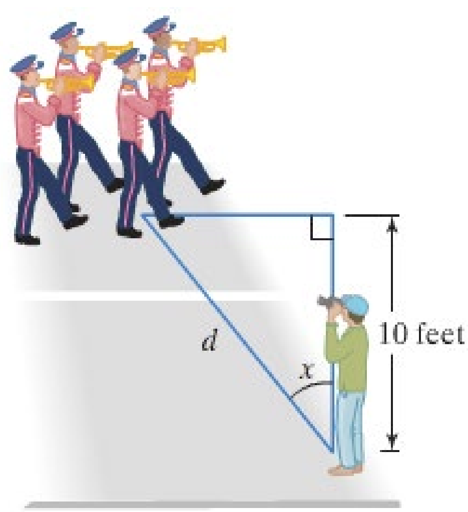


a) Verify that $d = h\csc\theta$

b) Determine θ when $d = 2h$

c) The atmosphere filters out the ultraviolet light that causes skin to burn, Compare the difference between sunbathing when $\theta = \frac{\pi}{2}$ and when $\theta = \frac{\pi}{3}$. Which measure gives less ultraviolet light?

16. Your friend is marching with a band and has asked you to film him. You have set yourself up 10 *feet* from the street where your friend will be passing from left to right. If *d* represents your distance, in feet, from your friend and *x* is the radian measure of the angle.



a) Express *d* in terms of a trigonometric function of *x*.

b) Graph the function for $-\frac{\pi}{2} \le x \le \frac{\pi}{2}$
