Section 1.6 – Precise Definition of a Limit

Example

Consider the function $y = 2x - 1$ near $x_0 = 4$. Intuitively it appears that *y* is close to 7 when *x* is close to 4, so $\lim\limits_{x \to 4} (2x - 1) = 7$. However, how close to $x_0 = 4$ does *x* have to be so that $y = 2x - 1$ differs from 7 by, say less than 2 units?

Solution

We need to find the values of *x* for $|y - 7| < 2$.

$|y - 7| = |2x - 1 - 7| = |2x - 8|$

$$|2x - 8| < 2$$

$$-2 < 2x - 8 < 2$$

$$-2 + 8 < 2x - 8 + 8 < 2 + 8$$

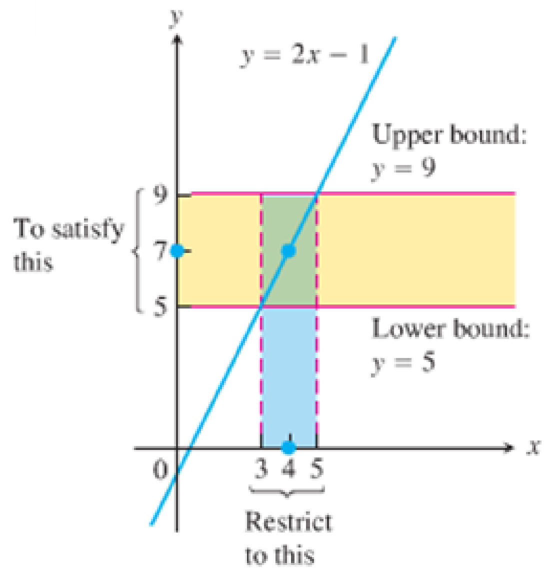
$$6 < 2x < 10$$

$$\frac{6}{2} < \frac{2x}{2} < \frac{10}{2}$$

$$3 < x < 5$$

$$3 - 4 < x - 4 < 5 - 4$$

$$-1 < x - 4 < 1$$



Keeping *x* within 1 unit of $x_0 = 4$ will keep *y* within 2 units of $y_0 = 7$

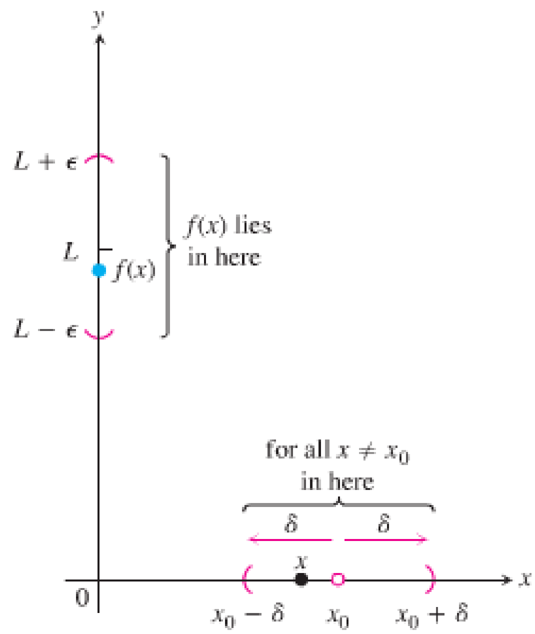
Definition

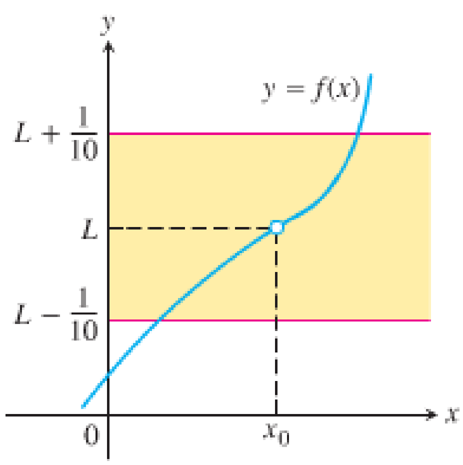
Let $f(x)$ be defined on an open interval about x_0, except possibly at x_0 itself. We say that **the limit of** $f(x)$ **as *x* approaches** x_0 **is the number *L***, and write

$$\lim_{x \to x_0} f(x) = L$$

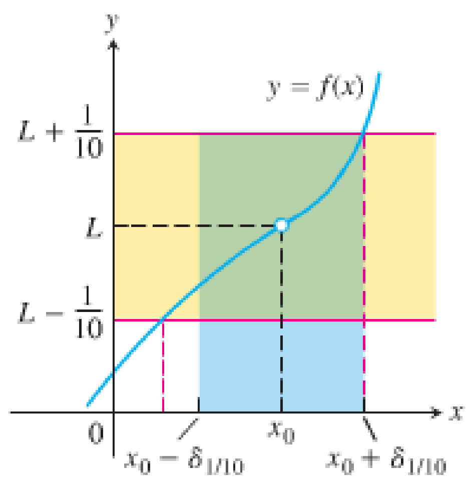
If, for every number $\varepsilon > 0$, there exists a corresponding number $\delta > 0$ such that for all *x*,

$$0 < |x - x_0| < \delta \quad \Rightarrow \quad |f(x) - L| < \varepsilon$$

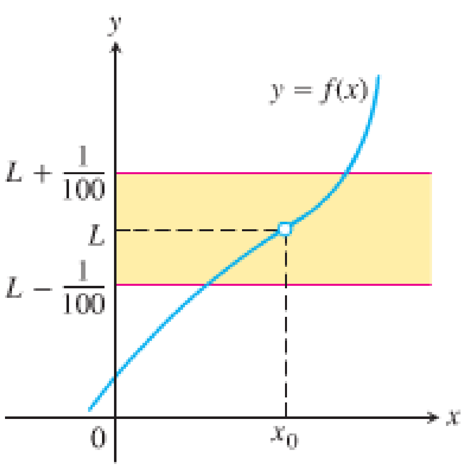




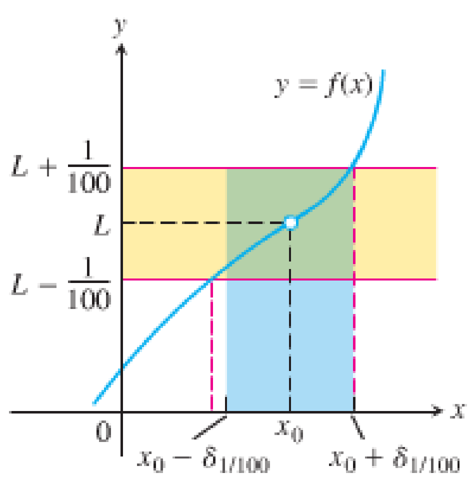
The challenge:
Make $|f(x) - L| < \epsilon = \frac{1}{10}$



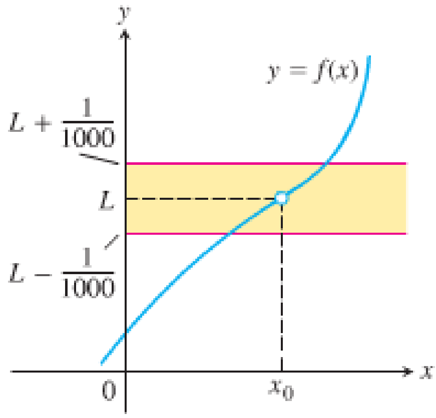
Response:
$|x - x_0| < \delta_{1/10}$ (a number)



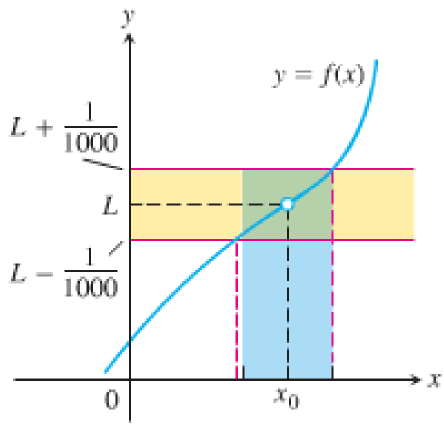
New challenge:
Make $|f(x) - L| < \epsilon = \frac{1}{100}$



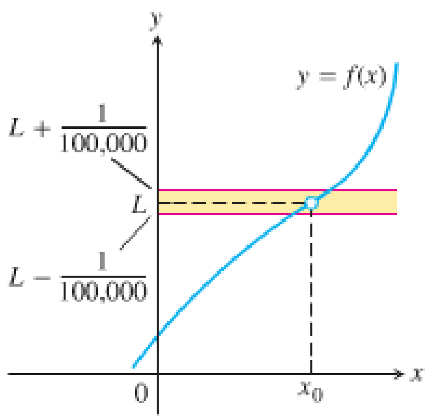
Response:
$|x - x_0| < \delta_{1/100}$



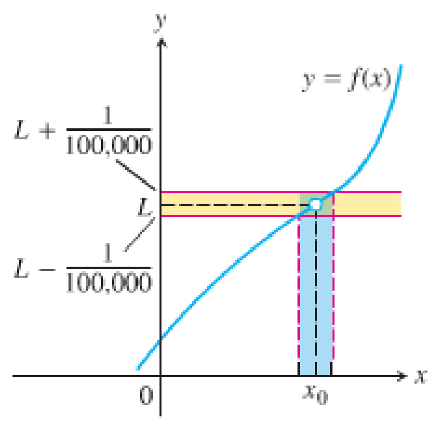
New challenge:
$\epsilon = \frac{1}{1000}$



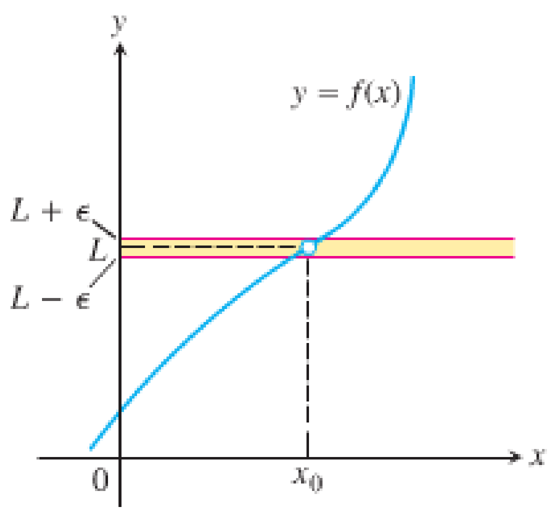
Response:
$|x - x_0| < \delta_{1/1000}$



New challenge:
$\epsilon = \frac{1}{100{,}000}$



Response:
$|x - x_0| < \delta_{1/100{,}000}$



New challenge:
$\epsilon = \cdots$

Example

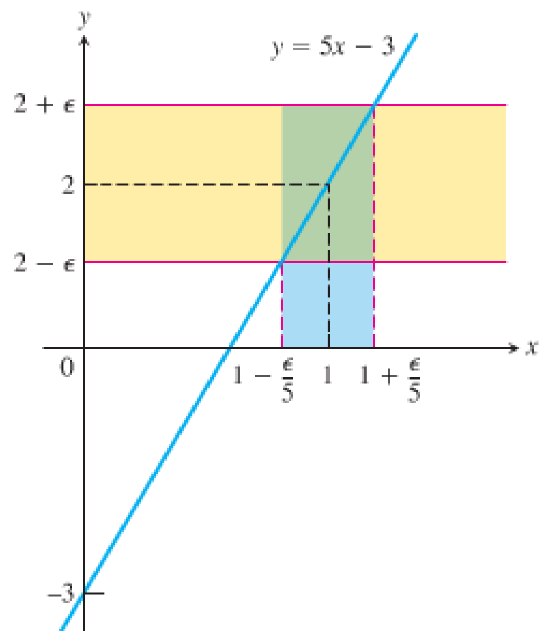
Show that $\lim_{x \to 1} (5x-3) = 2$

Solution

Let $x_0 = 1, \quad f(x) = 5x-3, \quad and \quad L = 2$.

For any given $\varepsilon > 0$, there exists a $\delta > 0$ so that $x \neq 1$ and x is within distance δ of $x_0 = 1$, that is

$$0 < |x-1| < \delta \quad \Rightarrow \quad |f(x) - 2| < \varepsilon$$



$$|(5x-3)-2| < \varepsilon$$

$$|5x-5| < \varepsilon$$

$$5|x-1| < \varepsilon$$

$$|x-1| < \frac{\varepsilon}{5}$$

Thus, we can take: $\delta = \frac{\varepsilon}{5}$

If $0 < |x-1| < \delta = \frac{\varepsilon}{5}$

$$|(5x-3)-2| = |5x-5| = 5|x-1| = 5\frac{\varepsilon}{5} = \varepsilon$$

Which proves that $\lim_{x \to 1} (5x-3) = 2$

Example

Prove the results presented graphically $\lim_{x \to x_0} x = x_0$

Solution

Let $\varepsilon > 0$ be given, we must find $\delta > 0$ such that for all x

$$0 < |x - x_0| < \delta \quad \Rightarrow \quad |x - x_0| < \varepsilon$$

This implication will hold if $\delta = \varepsilon$ or any smaller number.

Example

For the limit $\lim\limits_{x\to 5}\sqrt{x-1}=2$, find a $\delta>0$ that works for $\varepsilon=1$. That is, find a $\delta>0$ such that for all *x*:

$$0<|x-5|<\delta \quad\Rightarrow\quad \left|\sqrt{x-1}-2\right|<1$$

Solution

$$\left|\sqrt{x-1}-2\right|<1$$

$$-1<\sqrt{x-1}-2<1$$

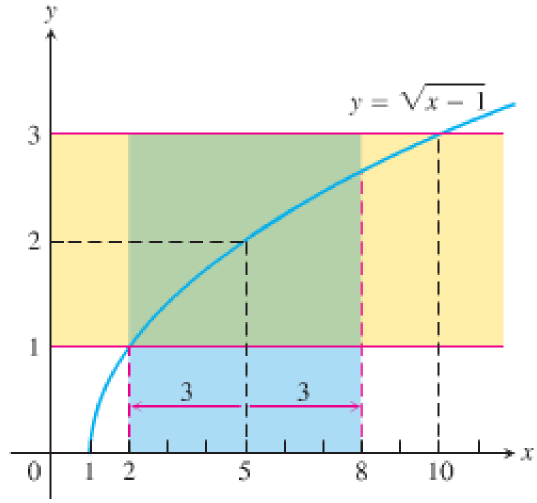
$$-1+2<\sqrt{x-1}-2+2<1+2$$

$$1<\sqrt{x-1}<3 \qquad \textit{Square all sides}$$

$$1<x-1<9$$

$$1+1<x-1+1<9+1$$

$$2<x<10$$



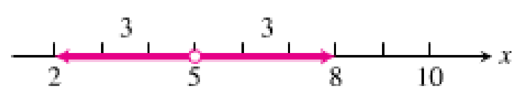
The inequality holds for all *x* in the open interval $(2,\ 10)$.

So it holds for all $x\neq 5$ in the interval as well.

Finding δ value.

$5-\delta<x<5+\delta$ Centered at $x_0=5$ inside the interval $(2,\ 10)$

$$\begin{cases}5-\delta=2\\ 5+\delta<10\end{cases}\rightarrow \delta=3 \ (\textit{to be centered})$$



$$0<|x-5|<3 \quad\Rightarrow\quad \left|\sqrt{x-1}-2\right|<1$$

How to Find *Algebraically* a δ for a Given *f*, *L*, x_0, and $\varepsilon>0$

The process of finding a $\delta>0$ such that for all *x*:

$$0<\left|x-x_0\right|<\delta \quad\Rightarrow\quad \left|f(x)-L\right|<\varepsilon$$

Can be accomplished in two steps

1. Solve the inequality $\left|f(x)-L\right|<\varepsilon$ to find an open interval $(a,\ b)$ containing x_0 on which the inequality holds for all $x\neq x_0$.
2. Find a value of $\delta>0$ that places the open interval $\left(x_0-\delta,\ x_0+\delta\right)$ centered at x_0 inside the interval $(a,\ b)$. The inequality $\left|f(x)-L\right|<\varepsilon$ will hold for all $x\neq x_0$ in this δ–interval.

Example

Prove that $\lim_{x \to 2} f(x) = 4$ if

$$f(x) = \begin{cases} x^2, & x \neq 2 \\ 1, & x = 2 \end{cases}$$

Solution

We need to show that given $\varepsilon > 0$ there exists a $\delta > 0$ such that for all x:

$$0 < |x - 2| < \delta \quad \Rightarrow \quad |f(x) - 4| < \varepsilon$$

1. *Solve the inequality $|f(x) - 4| < \varepsilon$ to find an open interval containing $x_0 = 2$ on which the inequality holds for all $x \neq x_0$.*

For $x \neq x_0 = 2$, $f(x) = x^2$, and the inequality to solve is $|x^2 - 4| < \varepsilon$:

$|x^2 - 4| < \varepsilon$

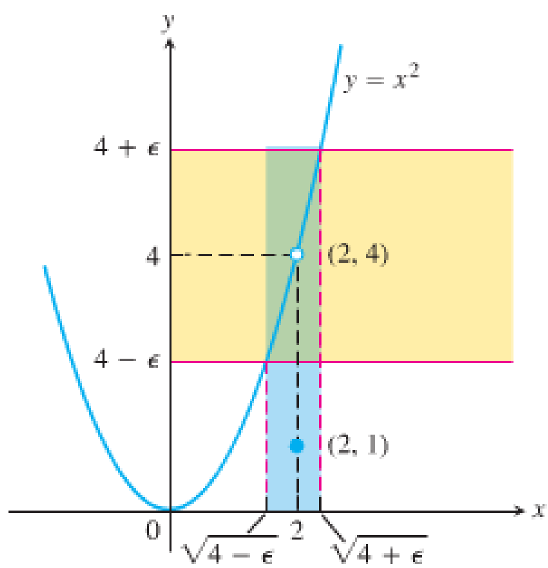
$-\varepsilon < x^2 - 4 < \varepsilon$ ***Add 4 to all sides***

$4 - \varepsilon < x^2 < 4 + \varepsilon$ ***Square root***

$\sqrt{4 - \varepsilon} < |x| < \sqrt{4 + \varepsilon}$ ***Assume $\varepsilon < 4$***

$\sqrt{4 - \varepsilon} < x < \sqrt{4 + \varepsilon}$

The inequality $|f(x) - 4| < \varepsilon$ holds for all $x \neq 2$ in the open interval $\left(\sqrt{4 - \varepsilon},\ \sqrt{4 + \varepsilon}\right)$



2. *Find a value of $\delta > 0$ that places the open interval $(2 - \delta,\ 2 + \delta)$ inside the interval $\left(\sqrt{4 - \varepsilon},\ \sqrt{4 + \varepsilon}\right)$.*

Take δ to be the distance from $x_0 = 2$ to the nearer endpoint of $\left(\sqrt{4 - \varepsilon},\ \sqrt{4 + \varepsilon}\right)$.

$$\Rightarrow \delta = \min\left(2-\sqrt{4-\varepsilon},\ \sqrt{4+\varepsilon}-2\right).$$

$$0<|x-2|<\delta$$

$$-\left(2-\sqrt{4-\varepsilon}\right)<x-2<\sqrt{4+\varepsilon}-2$$

$$-2+\sqrt{4-\varepsilon}<x-2<\sqrt{4+\varepsilon}-2$$

$$\sqrt{4-\varepsilon}<x<\sqrt{4+\varepsilon}$$

$$\therefore\ \ 0<|x-2|<\delta \quad \Rightarrow \quad |f(x)-4|<\varepsilon$$

Example

Given that $\lim\limits_{x\to c} f(x)=L$ *and* $\lim\limits_{x\to c} g(x)=M$, prove that $\lim\limits_{x\to c}\left(f(x)+g(x)\right)=L+M$

Solution

We need to show that given $\varepsilon>0$ there exists a $\delta>0$ such that for all x:

$$0<|x-c|<\delta \quad \Rightarrow \quad |f(x)+g(x)-(L+M)|<\varepsilon$$

$$\begin{aligned}|f(x)+g(x)-(L+M)| &= |f(x)+g(x)-L-M| \\ &= |(f(x)-L)+(g(x)-M)| \qquad \textit{Triangle Inequality } |a+b|\le|a|+|b| \\ &\le |(f(x)-L)|+|(g(x)-M)|\end{aligned}$$

Since $\lim\limits_{x\to c} f(x)=L$, there exists a number $\delta_1>0$ such that for all x:

$$0<|x-c|<\delta_1 \quad \Rightarrow \quad |f(x)-L|<\frac{\varepsilon}{2}$$

Similarly, since $\lim\limits_{x\to c} g(x)=M$, there exists a number $\delta_2>0$ such that for all x:

$$0<|x-c|<\delta_2 \quad \Rightarrow \quad |g(x)-M|<\frac{\varepsilon}{2}$$

Let $\delta=\min\{\delta_1,\ \delta_2\}$, the smaller of δ_1 and δ_2. If $0<|x-c|<\delta$ then $0<|x-c|<\delta_1$, so $|f(x)-L|<\frac{\varepsilon}{2}$ and $|x-c|<\delta_2$, so $|g(x)-M|<\frac{\varepsilon}{2}$. Therefore

$$|f(x)+g(x)-(L+M)|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$$

This show that $\lim\limits_{x\to c}\left(f(x)+g(x)\right)=L+M$

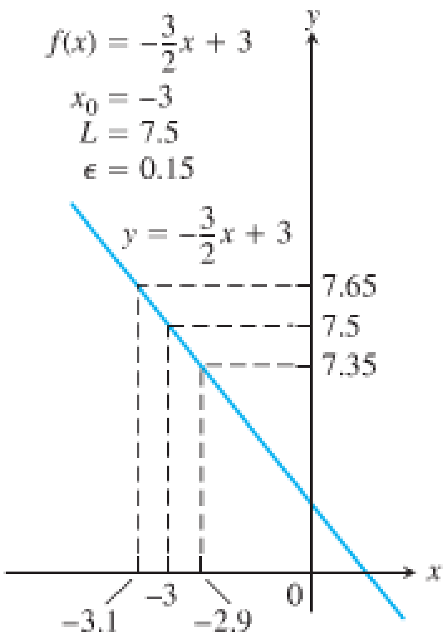
Exercises Section 1.6 – Precise Definition of Limits

Sketch the interval (a, b) on the x-axis with the point x_0 inside. Then find a value of $\delta > 0$ such that for all x, $0 < |x - x_0| < \delta \Rightarrow a < x < b$ for

1. $a = 1, \quad b = 7, \quad x_0 = 5$

2. $a = -\frac{7}{2}, \quad b = -\frac{1}{2}, \quad x_0 = -\frac{3}{2}$

3. Use the graph to find a $\delta > 0$ such that for all x $0 < |x - x_0| < \delta \Rightarrow |f(x) - L| < \varepsilon$



Find an open interval about x_0 on which the inequality $|f(x) - L| < \varepsilon$ holds. Then give a value for $\delta > 0$ such that for all x satisfying $0 < |x - x_0| < \delta$ the inequality $|f(x) - L| < \varepsilon$ holds.

4. $f(x) = x + 1, \quad L = 5, \quad x_0 = 4, \quad \varepsilon = 0.01$

5. $f(x) = \sqrt{x+1}, \quad L = 1, \quad x_0 = 0, \quad \varepsilon = 0.1$

6. $f(x) = \sqrt{x-7}, \quad L = 4, \quad x_0 = 23, \quad \varepsilon = 1$

7. $f(x) = x^2, \quad L = 3, \quad x_0 = \sqrt{3}, \quad \varepsilon = 0.1$

8. $f(x) = \frac{120}{x}, \quad L = 5, \quad x_0 = 24, \quad \varepsilon = 1$

Give a formal proof that

9. $\lim_{x\to 4}(9-x)=5$

10. $\lim_{x\to 1}\frac{1}{x}=1$

11. $\lim_{x\to 5}\frac{x^2-25}{x-5}=10$

12. $\lim_{x\to 0} f(x)=0$ *if* $f(x)=\begin{cases} 2x, & x<0 \\ \frac{x}{2}, & x\ge 0 \end{cases}$

13. $\lim_{x\to 1}(5x-2)=3$

14. $\lim_{x\to 2}\frac{1}{(x-2)^4}=\infty$

15. Prove that $\lim_{x\to 0} x\sin\left(\frac{1}{x}\right)=0$
