Lecture Four

Section 4.1 – Relations and Their Properties

Definition

Let A and B be sets. A binary relation from A to B is a subset of $A \times B$

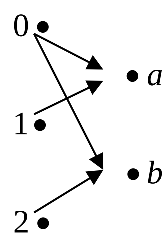
A binary relation from A to B is a set R of ordered pairs where the first element of each ordered pair comes from A and the second element comes from B. We use the notation $a\ R\ b$ to denote that $(a,\ b) \in R$ and $a \not R\ b$ to denote that $(a,\ b) \notin R$. Moreover, when $(a,\ b)$ belongs to R, a is said to be related to b by R.

Example

Let $A = \{0, 1, 2\}$ and $B = \{a, b\}$. Then $\{(0, a), (0, b), (1, a), (2, b)\}$ is a relation from A to B.

This means, for instance, that $0Ra$ but the $1 \not R b$.

Relations can be represented graphically, as shown below, using arrows to represent ordered pairs.



Another way to represent this relation is to use a table.

R	***a***	***b***
0	x	x
1	x	
2		x

Relations on a Set

Definition

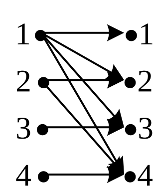
A ***relation*** on a set A is a relation from A to A. and it's a subset of $A \times A$

Example

Let A = {1, 2, 3, 4} which ordered pairs are the relation $R = \{(a,\ b) \mid a \text{ divides } b\}$?

Solution

R = {(1, 1), (1, 2), (1, 3), (1, 4), (2, 2), (2, 4), (3, 3), (4, 4)}



Example

Consider these relations on the set of integers:

$R_1 = \{(a,b) | \ a \le b\}$

$R_2 = \{(a,b) | \ a > b\}$

$R_3 = \{(a,b) | \ a = b \text{ or } a = -b\}$

$R_4 = \{(a,b) | \ a = b\}$

$R_5 = \{(a,b) | \ a = b + 1\}$

$R_6 = \{(a,b) | \ a + b \le 3\}$

Which of these relations contain each of the pairs (1, 1), (1, 2), (2, 1), (1, −1), and (2, 2)?

Solution

(1, 1) $\rightarrow$ $R_1, R_3, R_4, \textit{and } R_6$

(1, 2) $\rightarrow$ $R_1 \textit{ and } R_6$

(2, 1) $\rightarrow$ $R_2, R_5, \textit{and } R_6$

(1, −1) $\rightarrow$ $R_2, R_3, \textit{and } R_6$

(2, 2) $\rightarrow$ $R_1, R_3, \textit{and } R_4$

Example

How many relations are there on a set with *n* elements?

Solution

A relation on a set *A* is a subset of $A \times A$. Because $A \times A$ has n^2 elements when *A* has *n* elements, and a set with *m* elements has 2^m subsets, there are 2^{n^2} subset of $A \times A$.

Thus there are 2^{n^2} relations on a set with *n* elements.

Properties of Relations

Reflexive

Definition

A relation R on a set A is called ***reflexive*** if $(a, a) \in R$ for every element $a \in A$

Example

Consider the following relations on {1,2 ,3 ,4}:

$R_1 = \{(1, 1), (1, 2), (2, 1), (2, 2), (3, 4), (4, 1), (4, 4)\}$

$R_2 = \{(1, 1), (1, 2), (2, 1)\}$

$R_3 = \{(1, 1), (1, 2), (1, 4), (2, 1), (2, 2), (3, 3), (4, 1), (4, 4)\}$

$R_4 = \{(2, 1), (3, 1), (3, 2), (4, 1), (4, 2), (4, 3)\}$

$R_5 = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 2), (2, 3), (2, 4), (3, 3), (3, 4), (4, 4)\}$

$R_6 = \{(3, 4)\}$

Which of these relations are ***reflexive***?

Solution

The relations R_3 and R_5 are reflexive because they contain all pairs of the form (a, a), namely, (1, 1), (2, 2), (3, 3), and (4, 4).

$R_1, R_2, R_4, \textit{ and } R_6$ are not reflexive because (3, 3) is not in any of these relations.

Example

Is the "divides" relation on the set of positive integers reflexive?

Solution

Because $a|a$ whenever a is a positive integer, the "divides" relation is reflexive.

(0 is doesn't divide 0)

Symmetric

Definition

A relation R on a set A is called ***symmetric*** if $(b,a)\in R$ whenever $(a,b)\in R$, for all $a,b\in A$.

$$\forall a\forall b\left((a,\ b)\in R\rightarrow(b,\ a)\in R\right)$$

A relation R on a set A such that for all $a,b\in A$, if $(a,b)\in R$ and $(b,a)\in R$, then $a=b$ is called ***antisymmetric***.

$$\forall a\forall b\left(\left((a,\ b)\in R\wedge(b,\ a)\in R\right)\rightarrow(a=b)\right)$$

Example

Is the "divides" relation on the set of positive integers symmetric? Is it antisymmetric?

Solution

It is antisymmetric because $1|2$ bur $2\nmid 1$

Example

Consider the following relations on {1,2 ,3 ,4}:

$R_1=\{(1,\ 1),\ (1,\ 2),\ (2,\ 1),\ (2,\ 2),\ (3,\ 4),\ (4,\ 1),\ (4,\ 4)\}$

$R_2=\{(1,\ 1),\ (1,\ 2),\ (2,\ 1)\}$

$R_3=\{(1,\ 1),\ (1,\ 2),\ (1,\ 4),\ (2,\ 1),\ (2,\ 2),\ (3,\ 3),\ (4,\ 1),\ (4,\ 4)\}$

$R_4=\{(2,\ 1),\ (3,\ 1),\ (3,\ 2),\ (4,\ 1),\ (4,\ 2),\ (4,\ 3)\}$

$R_5=\{(1,\ 1),\ (1,\ 2),\ (1,\ 3),\ (1,\ 4),\ (2,\ 2),\ (2,\ 3),\ (2,\ 4),\ (3,\ 3),\ (3,\ 4),\ (4,\ 4)\}$

$R_6=\{(3,\ 4)\}$

Which of these relations are symmetric and which are antisymmetric?

Solution

The relations R_2 and R_3 are symmetric because in each case (b, a) belongs to the relation whenever (a, b) does. $(1,\ 2)$ *and* $(2,\ 1)$ in R_2 $(1,\ 2),\ (2,\ 1),\ (1,\ 4)$ *and* $(4,\ 1)$ in R_3.

The relations R_1, R_4, R_5 and R_6 are antisymmetric because for each relations there is no pair of elements a and b with $a\neq b$ such that both (a, b) and (b, a) belong to the relation.

Transitive

Definition

A relation $\boldsymbol{R}$ on a set $\boldsymbol{A}$ is called ***transitive*** if whenever $(a,\ b) \in R$ and $(b,\ c) \in R$ then $(a,\ c) \in R$, for all $a,\ b,\ c \in A$

$$\forall a \forall b \forall c \left(\left((a,\ b) \in R \wedge (b,\ c) \in R \right) \rightarrow (a,\ c) \in R \right)$$

Example

Consider the following relations on {1,2 ,3 ,4}:

$R_1 = \{(1,\ 1),\ (1,\ 2),\ (2,\ 1),\ (2,\ 2),\ (3,\ 4),\ (4,\ 1),\ (4,\ 4)\}$

$R_2 = \{(1,\ 1),\ (1,\ 2),\ (2,\ 1)\}$

$R_3 = \{(1,\ 1),\ (1,\ 2),\ (1,\ 4),\ (2,\ 1),\ (2,\ 2),\ (3,\ 3),\ (4,\ 1),\ (4,\ 4)\}$

$R_4 = \{(2,\ 1),\ (3,\ 1),\ (3,\ 2),\ (4,\ 1),\ (4,\ 2),\ (4,\ 3)\}$

$R_5 = \{(1,\ 1),\ (1,\ 2),\ (1,\ 3),\ (1,\ 4),\ (2,\ 2),\ (2,\ 3),\ (2,\ 4),\ (3,\ 3),\ (3,\ 4),\ (4,\ 4)\}$

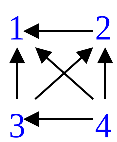
$R_6 = \{(3,\ 4)\}$

Which of these relations are transitive?

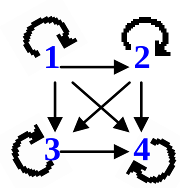
<u>Solution</u>

The relations R_4 and R_5 are transitive because in each of these relations case that is $(a,\ b)$ and $(b,\ c)$ belong to this relation then $(a,\ c)$ also does.

For R_4



For R_5



The relation R_1 is not transitive because $(3,\ 4)$ *and* $(4,\ 1)$ belong to R_1 but not $(3,\ 1)$

The relation R_2 is not transitive because $(2,\ 1)$ *and* $(1,\ 2)$ belong to R_2 but not $(2,\ 2)$

The relation R_3 is not transitive because $(4,\ 1)$ *and* $(1,\ 2)$ belong to R_3 but not $(4,\ 2)$

Example

Consider these relations on the set of integers:

$R_1 = \{(a, b) | \ a \le b\}$ $\qquad$ $R_2 = \{(a, b) | \ a > b\}$

$R_3 = \{(a, b) | \ a = b \text{ or } a = -b\}$ $\qquad$ $R_4 = \{(a, b) | \ a = b\}$

$R_5 = \{(a, b) | \ a = b+1\}$ $\qquad$ $R_6 = \{(a, b) | \ a+b \le 3\}$

Which of these relations contain each of the pairs (1, 1), (1, 2), (2, 1), (1, −1), and (2, 2)?

Solution

The relations R_1, R_2, R_3 and R_4 are transitive.

R_1 is transitive because $a \le b$ and $b \le c$ imply that $a \le c$

R_2 is transitive because $a > b$ and $b > c$ imply that $a > c$

R_3 is transitive because $a = \pm b$ and $b = \pm c$ imply that $a = \pm c$

R_4 is transitive because $a = b$ and $b = c$ imply that $a = c$

The relations R_5 and R_6 are not transitive.

R_5 is not transitive because $a = b+1$ and $b = c+1$ imply that $a = (c+1)+1 = c+2 \ne c+1$

R_6 is not transitive because $2+1 \le 3$ and $1+2 \le 3$ imply that $2+2 \not\le 3$

Example

Is the “divides” relation on the set of positive integers transitive?

Solution

Suppose *a* divides *b* and *b* divides *c*. Then there are positive integers *m* and *n* such that $b = ma$ and $c = nb$. Hence $c = n(ma) = (nm)a$, so *a* divides *c*.

Therefore this relation is transitive.

Combining Relations

Let *A* = {1, 2, 3} and *B* = {1, 2, 3, 4}.

The relations $R_1 = \{(1, 1), (2, 2), (3, 3)\}$ and $R_2 = \{(1, 1), (1, 2), (1, 3), (1, 4)\}$

$R_1 \cup R_2 = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 2), (3, 3)\}$

$R_1 \cap R_2 = \{(1, 1)\}$

$R_1 - R_2 = \{(2, 2), (3, 3)\}$

$R_2 - R_1 = \{(1, 2), (1, 3), (1, 4)\}$

Example

Let R_1 be the "less than" relation on the set of real numbers and let R_2 be the "greater than" relation on the set of real numbers, that is $R_1 = \{(x, y) | x < y\}$ and $R_2 = \{(x, y) | x > y\}$.
What are $R_1 \cup R_2$, $R_1 \cap R_2$, $R_1 - R_2$, $R_2 - R_1$, and $R_1 \oplus R_2$?

Solution

$(x, y) \in R_1 \cup R_2$ if and only if $(x, y) \in R_1$ *or* $(x, y) \in R_2$. That implies $(x, y) \in R_1 \cup R_2$ *iff* $x < y$ or $x > y$. Since $x < y$ or $x > y$ means that, that follows that $R_1 \cup R_2 = \{(x, y) | x \neq y\}$.

$R_1 \cap R_2 = \varnothing$, since it is impossible for a pair (x, y) to belong to both R_1 and R_2 because $x < y$ and $x > y$.

$R_1 - R_2 = R_1$, since $R_1 \cap R_2 = \varnothing$

$R_2 - R_1 = R_2$, since $R_1 \cap R_2 = \varnothing$

$R_1 \oplus R_2 = R_1 \cup R_2 - R_1 \cap R_2 = \{(x, y) | x \neq y\}$

Definition

Let *R* be a relation from a set *A* to a set *B* and *S* a relation from *B* to a set *C*. The composite of *R* and *A* is the relation consisting of ordered pairs (*a*, *c*), where $a \in A, c \in C$, and for which there exists an element $b \in B$ such that $(a, b) \in R$ and $(b, c) \in S$. We denote the composite of *R* and *S* by $S \circ R$.

Example

What is the composite of the relation *R* and *S*, where
R is the relation from {1, 2, 3} to {1, 2, 3, 4} with *R* = {(1, 1), (1, 4), (2, 3), (3, 1), (3, 4)}.
S is the relation from {1, 2, 3, 4} to {0, 1, 2} with *S* = {(1, 0), (2, 0), (3, 1), (3, 2), (4, 1)}.

Solution

$$\begin{array}{cccc} R & S & & S \circ R \\ (1,1) & (1,0) & \to & (1,0) \\ (1,4) & (4,1) & \to & (1,1) \\ (2,3) & (3,1) & \to & (2,1) \\ (2,3) & (3,2) & \to & (2,2) \\ (3,1) & (1,0) & \to & (3,0) \\ (3,4) & (4,1) & \to & (3,1) \end{array}$$

$S \circ R = \{(1,0), (1,1), (2,1), (2,2), (3,0), (3,1)\}$

Definition

Let R be a relation on the set A. Then powers R^n, $n = 1, 2, 3, \dots$ are defined recursively by

$$R^1 = R \quad and \quad R^{n+1} = R^n \circ R$$

Example

Let R = {(1, 1), (2, 1), (3, 2), (4, 3)}. Find the powers R^n, $n = 2, 3, 4, \dots$

Solution

$R^2 = R \circ R = \{(1, 1), (2, 1), (3, 1), (4, 2)\}$

$R^3 = R^2 \circ R = \{(1, 1), (2, 1), (3, 1), (4, 1)\}$

$R^4 = R^3 \circ R = \{(1, 1), (2, 1), (3, 1), (4, 1)\}$

From that , it follows that $R^n = R^3$ for n = 5, 6, 7, ….

Theorem

The relation on a set A is transitive ***iff*** $R^n \subseteq R$ for n = 1, 2, 3, ….

Proof

Suppose that $R^n \subseteq R$ for n = 1, 2, 3, …. In particular, $R^2 \subseteq R$. If $(a, b) \in R$ and $(b, c) \in R$, then by definition of composite, $(a, c) \in R^2$. Because $R^2 \subseteq R$, this means that $(a, c) \in R$. Hence, R is transitive.

Using mathematical induction to prove the only if part of the theorem

Assume that $R^n \subseteq R$ where n is a positive integer. This is the inductive hypothesis.

To complete the inductive step we must show that this implies that R^{n+1} is also a subset of R.

Assume that $(a, b) \in R^{n+1}$, then because $R^{n+1} = R^n \circ R$, there is an element x with $x \in A$ such that $(a, x) \in R$ and $(x, b) \in R^n$. The inductive hypothesis, namely, that $R^n \subseteq R$, implies that $(x, b) \in R$

Furthermore, because R is transitive, and $(a, x) \in R$ and $(x, b) \in R$, it follows that $(a, b) \in R$.

This shows that $R^n \subseteq R$.

Exercises *Section* 4.1 – Relations and Their Properties

1. List the ordered pairs in the relation R from $A = \{0, 1, 2, 3, 4\}$ to $B = \{0, 1, 2, 3\}$ where $(a, b) \in R$ if and only if

a) $a = b$ *b*) $a + b = 4$ *c*) $a > b$

d) $a \mid b$ *e*) $gcd(a,b) = 1$ *f*) $lcm(a,b) = 2$

2. *a*) List all the ordered pairs in the relation $R = \{(a,\ b) \mid a \text{ divides } b\}$ on the set {1, 2, 3, 4, 5, 6}

b) Display this relation graphically.

c) Display this relation in tabular form.

3. For each of these relations on the set {1, 2, 3, 4}, decide whether it is reflexive, symmetric, antisymmetric and transitive

a) {(2, 2), (2, 3), (2, 4), (3, 2), (3, 3), (3, 4)}
b) {(1, 1), (1, 2), (2, 1), (2, 2), (3, 3), (4, 4)}
c) {(2, 4), (4, 2)}
d) {(1, 2), (2, 3), (3, 4)}
e) {(1, 1), (2, 2), (3, 3), (4, 4)}
f) {(1, 3), (1, 4), (2, 3), (2, 4), (3, 1), (3, 4)}

4. Determine whether the relation R on the set of all people is reflexive, symmetric, antisymmetric, and/or transitive, where $(a, b) \in R$ if and only if

a) a is taller than b.
b) a and b were born on the same day
c) a has the same first name as b.
d) a and b have a common grandparent.

5. Determine whether the relation ***R*** on the set of all ***real numbers*** is reflexive, symmetric, antisymmetric, and/or transitive, where $(x,\ y) \in \boldsymbol{R}$ if and only if

a) $x + y = 0$ *b*) $x = \pm y$ *c*) $x - y$ *is a rational number* *d*) $x = 2y$

e) $xy \ge 0$ *f*) $xy = 0$ *g*) $x = 1$ *h)* $x = 1$ *or* $y = 1$

6. Determine whether the relation R on the set of all ***integers numbers*** is reflexive, symmetric, antisymmetric, and/or transitive, where $(x,\ y) \in R$ if and only if

a) $x \ne y$ *b*) $xy \ge 1$ *c*) $x = y + 1$ *or* $x = y - 1$ *d*) $x \equiv y (\textbf{mod}\ 7)$

e) x *is a multiple of* y *f*) $x = y^2$ *g*) $x \ge y^2$

7. Show that the relation $R = \varnothing$ on nonempty set S is symmetric and transitive, but not reflexive.

8. Show that the relation $R = \varnothing$ on nonempty set $S = \varnothing$ is reflexive, symmetric and transitive.

9. Give an example of a relation on a set that is

a) both symmetric and antisymmetric

b) neither symmetric nor antisymmetric

10. A relation R is called ***asymmetric*** if $(a,b)\in R$ implies that $(b,a)\notin R$. Explore the notion of an asymmetric relation to the following

a) {(2, 2), (2, 3), (2, 4), (3, 2), (3, 3), (3, 4)}

b) {(1, 1), (1, 2), (2, 1), (2, 2), (3, 3), (4, 4)}

c) {(2, 4), (4, 2)}

d) {(1, 2), (2, 3), (3, 4)}

e) {(1, 1), (2, 2), (3, 3), (4, 4)}

f) {(1, 3), (1, 4), (2, 3), (2, 4), (3, 1), (3, 4)}

g) *a* is taller than *b*.

h) *a* and *b* were born on the same day

i) *a* has the same first name as *b*.

j) *a* and *b* have a common grandparent.

11. Let R be the relation $R=\{(a,\ b)|\ a<b\}$ on the set of integers. Find

a) R^{-1} ***b)*** $\bar{R}$

12. Let R be the relation $R=\{(a,\ b)|\ a \textit{ divides } b\}$ on the set of positive integers. Find

a) R^{-1} ***b)*** $\bar{R}$

13. Let R be the relation on the set of all states in the U.S. consisting of pairs (a, b) where state a borders state b. Find

a) R^{-1} ***b)*** $\bar{R}$

14. Let $R_1=\{(1,\ 2),\ (2,\ 3),\ (3,\ 4)\}$ and

$R_2=\{(1,\ 1),\ (1,\ 2),\ (2,\ 1),\ (2,\ 2),\ (2,\ 3),\ (3,\ 1),\ (3,\ 2),\ (3,\ 3),\ (3,\ 4)\}$ be relation from {1, 2, 3} to {1, 2, 3, 4}. Find

a) $R_1\cup R_2$ ***b***) $R_1\cap R_2$ ***c***) R_1-R_2 ***d***) R_2-R_1

15. Let the relation R = {(1, 2), (1, 3), (2, 3), (2, 4), (3, 1)} and the relation S = {(2, 1), (3, 1), (3, 2), (4, 2)}. Find $S\circ R$

16. $R_1=\{(a,b)\in \boldsymbol{R}^2|a>b\}$ $R_3=\{(a,b)\in \boldsymbol{R}^2|a<b\}$ $R_5=\{(a,b)\in \boldsymbol{R}^2|a=b\}$

$R_2=\{(a,b)\in \boldsymbol{R}^2|a\ge b\}$ $R_4=\{(a,b)\in \boldsymbol{R}^2|a\le b\}$ $R_6=\{(a,b)\in \boldsymbol{R}^2|a\ne b\}$

Find the following:
