Solution Section 2.6 - Mechanical systems

Exercise

A 1-*kg* mass is attached to a spring $k = 4kg/s^2$ and the system is allowed to come to rest. The spring-mass system is attached to a machine that supplies external driving force $f(t) = 4\cos\omega t$ *Newtons*. The system is started from equilibrium; the mass is having neither initial displacement nor velocity. Ignore any damping forces.

a) Find the position of the mass as a function of time

b) Place your answer in the form $s(t) = A\sin\delta t\sin\overline{\omega}t$. Select an ω near the natural frequency of the system to demonstrate the "beating" of the system. Sketch a plot shows the "beats:" and include the envelope of the beating motion in your plot.

Solution

a) $mx'' + \omega_0^2 x = f(t)$

$$mx'' + kx = f(t) \qquad\qquad x(0) = x'(0) = 0$$

$$x'' + 4x = 4\cos\omega t$$

$$x(t) = \frac{A}{\left(\omega_0^2 - \omega^2\right)}\left(\cos\omega t - \cos\omega_0 t\right)$$

$$x(t) = \frac{4}{4-\omega^2}\left(\cos\omega t - \cos 2t\right)$$

b) $x(t) = \frac{4}{4-\omega^2}\left(\cos\omega t - \cos 2t\right)$ $\qquad\qquad \cos\alpha - \cos\beta = -2\sin\left(\frac{\alpha+\beta}{2}\right)\sin\left(\frac{\alpha-\beta}{2}\right)$

$$= \frac{4}{4-\omega^2}\left[-2\sin\left(\frac{\omega+2}{2}t\right)\sin\left(\frac{\omega-2}{2}t\right)\right]$$

$$= \frac{4}{4-\omega^2}\left[2\sin\left(\frac{\omega+2}{2}t\right)\sin\left(\frac{2-\omega}{2}t\right)\right]$$

Mean frequency: $\overline{\omega} = \frac{\omega_0 + \omega}{2} = \frac{2+\omega}{2}$

$$2\overline{\omega} = 2 + \omega$$

Half difference: $\delta = \frac{\omega_0 - \omega}{2} = \frac{2-\omega}{2}$

$$2\delta = 2 - \omega$$

$$4 - \omega^2 = (2+\omega)(2-\omega) = 2\overline{\omega}2\delta$$

$$= 2\overline{\omega}2\delta$$

$$= 4\overline{\omega}\delta$$

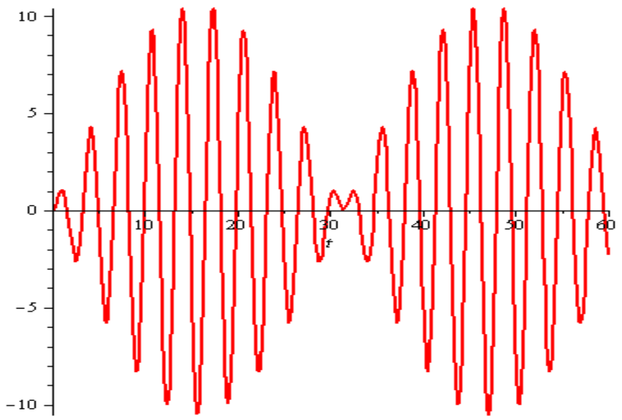
$$x(t) = \frac{8}{4\varpi\delta}\sin\varpi t \sin\delta t$$

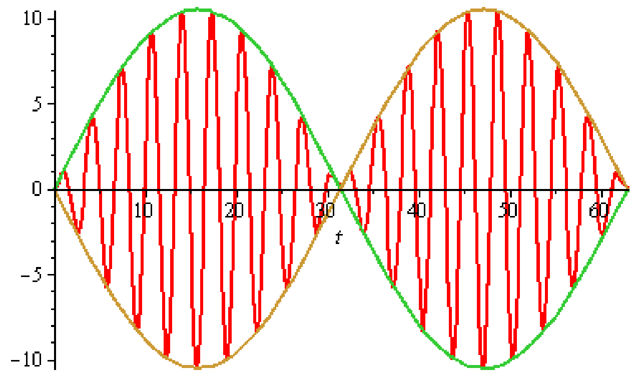
$$= \frac{2}{\varpi\delta}\sin\varpi t \sin\delta t$$

If we choose $\omega = 1.8$ near to $\omega_0 = 2$

That implies to: $\bar{\omega} = \frac{2+1.8}{2} \approx 1.9$ and $\delta = \frac{2-1.8}{2} \approx 0.1$

$$x(t) = \frac{2}{0.19}(\sin 0.1t)(\sin 1.9t)$$





Exercise

Find a particular solution to the differential equation using undetermined coefficients. Find and plot the solution of the initial value problem. Superimpose the plots of the transient response and the steady state solution.

$$x'' + 7x' + 10x = 3\cos 3t \qquad x(0) = -1, \ x'(0) = 0$$

Solution

The particular solution: $x(t) = a\cos 3t + b\sin 3t$

$$x' = -3a\sin 3t + 3b\cos 3t$$
$$x'' = -9a\cos 3t - 9b\sin 3t$$

$$-9a\cos 3t - 9b\sin 3t + 7(-3a\sin 3t + 3b\cos 3t) + 10(a\cos 3t + b\sin 3t) = 3\cos 3t$$

$$-9a\cos 3t - 9b\sin 3t - 21a\sin 3t + 21b\cos 3t + 10a\cos 3t + 10b\sin 3t = 3\cos 3t$$

$$a\cos 3t - 21a\sin 3t + 21b\cos 3t + b\sin 3t = 3\cos 3t$$

$$(a + 21b)\cos 3t + (b - 21a)\sin 3t = 3\cos 3t$$

$$\begin{aligned} a + 21b &= 3 \\ -21a + b &= 0 \end{aligned} \Rightarrow a = \frac{3}{442} \quad b = \frac{63}{442}$$

The particular solution (***steady-state solution***):

$$\boxed{x_p(t)=\frac{3}{442}\cos 3t+\frac{63}{442}\sin 3t}$$

The homogeneous eq.: $x''+7x'+10x=0$

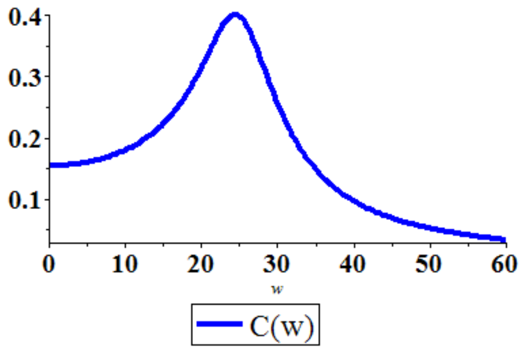
$$A=\frac{100\left(650-\omega^2\right)}{\left(650-\omega^2\right)^2+100\omega^2}=\frac{100\left(650-\omega^2\right)}{422{,}500-1200\omega^2+\omega^4}$$ $$A=\frac{\left(k-m\omega^2\right)F_0}{\left(k-m\omega^2\right)^2+(c\omega)^2}$$

$$B = \frac{1000\omega}{422{,}500 - 1200\omega^2 + \omega^4} \qquad B = \frac{c\omega F_0}{\left(k - m\omega^2\right)^2 + (c\omega)^2}$$

$$C(\omega) = \frac{100}{\sqrt{422{,}500 - 1200\omega^2 + \omega^4}} \qquad C(\omega) = \frac{F_0}{\sqrt{\left(k - m\omega^2\right)^2 + (c\omega)^2}}$$



$$C'(\omega) = -\frac{500\left(-2400\omega + 4\omega^3\right)}{\left(422{,}500 - 1200\omega^2 + \omega^4\right)^{3/2}} = 0$$

$$\omega\left(4\omega^2 - 2400\right) = 0 \quad \Rightarrow \quad \omega = \sqrt{600} \; \underline{= 10\sqrt{6}|} \; (C.N)$$

$C(\omega)$ starts with $C(0) = \frac{2}{13}$, hence the practical resonance frequency is $\omega = 10\sqrt{6}$.

Exercise

A mass weighing 100 *lb*. (mass m = 3.125 *slugs* in *fps* units) is attached to the end of a spring that is stretched 1 *in*. by a force of 100 *lb*. A force $F_0 \cos\omega t$ acts on the mass. At what frequency (in hertz) will resonance oscillation occur? Neglect damping.

Solution

Given: m = 3.125 *slug*

$$k = \frac{F}{x} = \frac{100\ lb}{1\ in}\frac{12\ in}{1\ ft} \; \underline{= 1200\ lb/ft|}$$

$$\omega_0 = \sqrt{\frac{k}{m}}$$

$$= \sqrt{\frac{1200}{3.125}}$$

$$= \sqrt{384} \quad rad/\sec$$

$$\underline{= \frac{\sqrt{384}}{2\pi} \; Hz.|} \quad \approx 3.12\ Hz.$$

Consider a floating cylindrical buoy with radius *r*, height *h*, and uniform density $\rho \le 0.5$ (recall that the density of water is 1 g/cm^3). The buoy is initially suspended at rest with its bottom at the top surface of the water and is released at time $t=0$. Therafter it is acted on by two forces: a downward gravitational force equal to its weight $mg = \pi r^2 hg$ and (by Archmedes' principle of buoyancy) an upward force equal to the wieght $\pi r^2 xg$ of water displaced, where $x = x(t)$ is the depth of the bottom of the buoy beneath the surface at time *t*.

Conclude that the buoy undergoes simple harmonic motion around its equilibrium position $x_e = \rho h$ with period $p = 2\pi\sqrt{\frac{\rho h}{g}}$.

a) Compute *p* and the amplitude of the motion if $\rho = 0.5\ g/cm^3$, $h = 200\ cm$, and $g = 980\ cm/s^2$

b) If the cylindrical buoy weighting 100 *lb* floats in water with its axis vertical. When depressed slightly and released, it oscillates up and down four times every 10 *sec*. assume that friction is negligible. Find the radius of the buoy.

Exercise

Assume that the earth is a solid sphere of uniform density, with mass M and radius $R = 3960$ (mi). For a particle of mass m within the earth at distance r from the center of the earth, the gravitational force attracting m toward the center is $F_r = -\frac{GM_r m}{r^2}$, where M_r is the mass of the part of the earth within a sphere of radius r.

a) Show that $F_r = -\frac{GMmr}{R^3}$

b) Now suppose that a small hole is drilled straight through the center of the earth, thus connecting two antipodal points on its surface. Let a particle of mass m be dropped at time $t = 0$ into this hole with initial speed zero, and let $r(t)$ be its distance from the center of the earth at time t. conclude from Newton's second law and part (a) that $r''(t) = -k^2 r(t)$, where $k^2 = \frac{GM}{R^3} = \frac{g}{R}$.

c) Take $g = 32.2\ ft/s^2$, and conclude from part (b) that the particle undergoes simple harmonic motion back and forth between the ends of the hole, with a period of about 84 *min*.

d) Look up (or derive) the period of a satellite that just skims the surface of the earth; compare with the result in part (c). How do you explain the coincidence? Or is it a coincidence?

e) With what speed (in miles per hours) does the particle pass through the center of the earth?

f) Look up (or derive) the orbital velocity of a satellite that just skims the surface of the earth; compare with the result in part (e). How do you explain the coincidence? Or is it a coincidence?

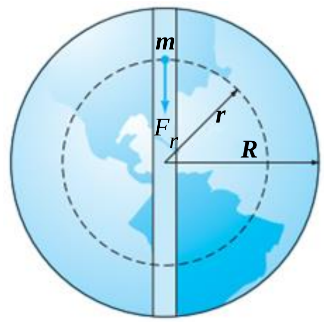
Solution

a) $M_r = M\left(\frac{r}{R}\right)^3$

$$F_r = -\frac{GM_r m}{r^2}$$

$$= -\frac{Gm}{r^2} M \frac{r^3}{R^3}$$

$$\boxed{= -\frac{GMmr}{R^3}}$$



b) Since $\frac{GM}{R^3} = \frac{g}{R}$

$$mr'' = F_r$$

$$mr'' = -\frac{GM}{R^3} mr$$

$$\boxed{r'' + \frac{g}{R} r = 0}$$

c) $r'' + \frac{g}{R} r = 0$

$$\lambda^2 + \frac{g}{R} = 0 \quad \rightarrow \quad \lambda = \pm i\sqrt{\frac{g}{R}}$$

$$r(t) = A\cos\left(\sqrt{\frac{g}{R}}\, t\right) + B\sin\left(\sqrt{\frac{g}{R}}\, t\right) \qquad r(0) = R \quad r'(0) = 0$$

$$r(0) = \underline{A = R}$$

$$r'(t) = -A\sqrt{\frac{g}{R}}\sin\left(\sqrt{\frac{g}{R}}\, t\right) + B\sqrt{\frac{g}{R}}\cos\left(\sqrt{\frac{g}{R}}\, t\right) \rightarrow r'(0) = B\sqrt{\frac{g}{R}} = 0 \Rightarrow \underline{B = 0}$$

$$r(t) = R\cos\omega_0 t; \quad \omega_0 = \sqrt{\frac{g}{R}}$$

Given: $g = 32.2\ ft/\sec^2 \quad R = (3960)(5280)\ ft$

The period of the particle's simple harmonic motion is:

$$P = \frac{2\pi}{\omega_0} = 2\pi\sqrt{\frac{R}{g}} = 2\pi\sqrt{\frac{3960 \times 5280}{32.2}} \quad \underline{\approx 84.38\ min}$$

d) The orbital velocity v of such a satellite must be such that the centrifugal force $\frac{mv^2}{R}$ on the satellite just offsets the weight mg of the satellite at the surface of the earth. Thus

$$\frac{mv^2}{R} = mg \quad \Rightarrow \quad v = \sqrt{gR} = \sqrt{32.2 \times 3960\ mi \times \frac{5280\ ft}{1\ mi}}$$

$$\underline{\approx 2.5947 \times 10^4\ ft/\sec}$$

$$\approx 2.5947 \times 10^4 \frac{ft}{\sec} \frac{1\ mi}{5280\ ft} \frac{3600\ \sec}{1\ hr} \ \underline{\approx 1.7691 \times 10^4\ mi/hr}$$

Because the circumference of the earth is $2\pi R$, the period of the satellite's orbit is

$$\frac{2\pi}{\sqrt{gR}} = 2\pi\sqrt{\frac{R}{g}} = 2\pi\sqrt{\frac{3960\times 5280}{32.2}} \ \underline{\approx 84.38\ min|}$$

Let assume that at time $t=0$, the satellite is directly over the hole in the earth at the top, and its orbit proceeds in a clockwise direction.

The distance r of the particle, from part (c), from the center of the earth is

$$r(t) = R\cos\omega_0 t; \quad \omega_0 = \sqrt{\frac{g}{R}}$$

The key observation is that $\omega_0 t$ is the angle drawn clockwise from the vertical to the radius vector of the satellite at time t; thus, the distance $r(t)$ is simply the vertical component of the satellite's position. It follows that $r(t)$ completes one cycle through the earth (and back) in the same length of time required for the satellite to complete one orbit around the earth.

e) The particle passes through the center of the earth when $r(t) = R\cos\omega_0 t = 0$, that is when

$\omega_0 t = \frac{\pi}{2} \quad \rightarrow t = \frac{\pi}{2\omega_0}$.

At this time the speed of the particle is

$$r'(t) = -R\omega_0 \sin\omega_0 t$$

$$|r'(t)| = \left| -R\omega_0 \sin\left(\omega_0 \frac{\pi}{2\omega_0}\right)\right|$$

$$= R\omega_0$$

$$= R\sqrt{\frac{g}{R}} = \sqrt{gR}$$

$$\underline{\approx 1.7691\times 10^4\ mi/hr|} \quad part(d)$$

f) The orbital velocity is $v = \sqrt{gR}$.

The vertical component of the satellite's velocity vector $v(t)$ at any given time t is equal to the speed $|r'(t)|$ of the particle at that time.

At the moment when the particle passes through the center of earth, the satellite is travelling straight downward, and hence $v(t)$ is vertical.

Therefore, the orbital velocity v of the satellite, which is the magnitude of $v(t)$, is equal to the speed of the particle at this moment.

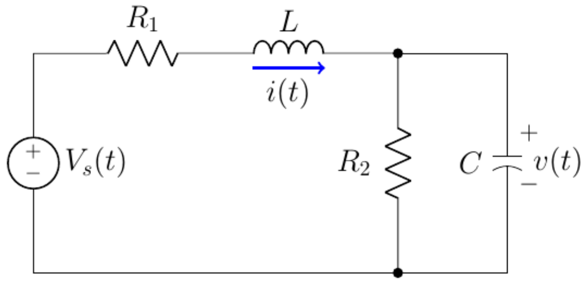
Express the given circuit in the second-order differential equation



Solution

$$V_s = R_1 i + L\frac{di}{dt} + v(t)$$

$$i(t) = \frac{v(t)}{R_2} + C\frac{d}{dt}v(t)$$

$$V_s = R_1\left(\frac{v}{R_2} + C\frac{dv}{dt}\right) + L\frac{d}{dt}\left(\frac{v}{R_2} + C\frac{dv}{dt}\right) + v$$

$$= \frac{R_1}{R_2}v + R_1 C\frac{dv}{dt} + \frac{L}{R_2}\frac{dv}{dt} + LC\frac{d^2v}{dt^2} + v$$

$$= LC\frac{d^2v}{dt^2} + \left(R_1 C + \frac{L}{R_2}\right)\frac{dv}{dt} + \left(\frac{R_1}{R_2} + 1\right)v(t)$$

$$= LC\frac{d^2v}{dt^2} + \left(R_1 C + \frac{L}{R_2}\right)\frac{dv}{dt} + \left(\frac{R_1 + R_2}{R_2}\right)v(t)$$

$$= i(t) + C\frac{d}{dt}v(t)$$

$$V_S = R_1\left(i + C\frac{dv}{dt}\right) + v(t) \qquad\qquad V_S = V_{R_1} + V_C$$

$$= R_1 i + R_1 C\frac{d}{dt}\left(R_2 i + L\frac{di}{dt}\right) + R_2 i + L\frac{di}{dt}$$

$$= R_1 i + R_1 R_2 C\frac{di}{dt} + R_1 CL\frac{d^2 i}{dt^2} + R_2 i + L\frac{di}{dt}$$

Find the steady-state solution $q_p(t)$ and the steady-state current in and LRC–series circuit when the source voltage is $E(t) = E_0 \sin\omega t$

Solution

$$Lq'' + Rq' + \frac{1}{C}q = E_0 \sin\omega t$$

$$L\lambda^2 + R\lambda + \frac{1}{C} = 0 \quad\rightarrow\quad \lambda_{1,2} = \frac{-R \pm \sqrt{R^2 - \frac{4L}{C}}}{2L} = \frac{-R\sqrt{C} \pm \sqrt{R^2 C - 4L}}{2L\sqrt{C}}$$

$$q_p = A\cos\omega t + B\sin\omega t$$

$$q'_p = -\omega A\sin\omega t + \omega B\cos\omega t$$

$$q''_p = -\omega^2 A\cos\omega t - \omega^2 B\sin\omega t$$

$$-\omega^2 LA\cos\omega t - \omega^2 LB\sin\omega t - \omega RA\sin\omega t + \omega RB\cos\omega t + \frac{1}{C}A\cos\omega t + \frac{1}{C}B\sin\omega t = E_0 \sin\omega t$$

$$\begin{cases} \cos\omega t & \left(-\omega^2 L + \frac{1}{C}\right)A + \omega RB = 0 \\ \sin\omega t & -\omega RA + \left(\frac{1}{C} - \omega^2 L\right)B = E_0 \end{cases}$$

$$\Delta = \begin{vmatrix} \frac{1}{C} - \omega^2 L & \omega R \\ -\omega R & \frac{1}{C} - \omega^2 L \end{vmatrix} = \frac{1}{C^2} - \frac{2\omega^2 L}{C} + \omega^4 L^2 + \omega^2 R^2 = \frac{1}{C^2}\left(1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2\right)$$

$$\Delta_A = \begin{vmatrix} 0 & \omega R \\ E_0 & \frac{1}{C} - \omega^2 L \end{vmatrix} = \omega RE_0 \qquad \Delta_B = \begin{vmatrix} \frac{1}{C} - \omega^2 L & 0 \\ -\omega R & E_0 \end{vmatrix} = \left(\frac{1}{C} - \omega^2 L\right)E_0$$

$$A = \frac{\omega RC^2 E_0}{1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2} \qquad B = \frac{C(1 - \omega LC)E_0}{1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2}$$

Therefore, the steady-state charge is:

$$\boxed{q_p(t) = \frac{CE_2}{1-2\omega^2 LC + \omega^4 L^2C^2 + \omega^2 R^2C^2}\left(\omega RC\cos\omega t + (1-\omega LC)\sin\omega t\right)}$$

Exercise

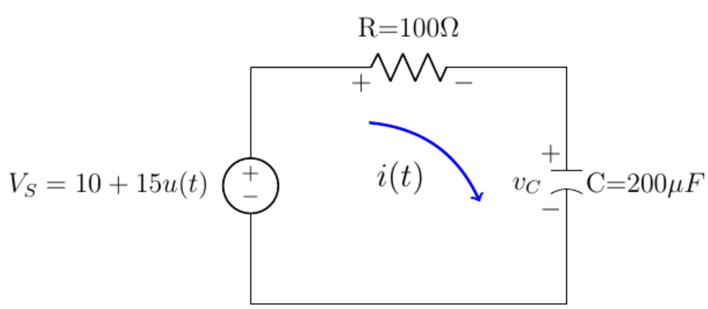
Consider the given circuit. Assuming that the voltage source changes from 10 to 25 V at time $t = 0$, $v_s = 10 + 15u(t)\ V$, where $u(t)$ is a unit step function.



Find the expressions that describe the voltage drop across the resistor across the capacitor and the current in the loop for $t > 0$

Solution

Given: $R = 100\ \Omega, \quad C = 200\ \mu F, \quad v_S\left(0^-\right) = 10, \quad v_S = 25 \quad i\left(0^-\right) = 0$

$$i_s(0) = \frac{v_s - v_s\left(0^-\right)}{R} = \frac{25-10}{100} = 0.15$$

Applying Kirkoff Voltage law: $v_R + v_C - v_s = 0$

$$v_R + v_C = v_s$$

$$Ri + \frac{1}{C}q = v_s$$

$$R\frac{di}{dt} + \frac{1}{C}\frac{dq}{dt} = \frac{dv_S}{dt} \qquad\qquad i = \frac{dq}{dt}$$

$$R\frac{di}{dt} + \frac{1}{C}i = \frac{dv_S}{dt}$$

$$\frac{di}{dt} + \frac{1}{RC}i = \frac{1}{R}\frac{dv_S}{dt} \qquad\qquad \frac{1}{RC} = \frac{1}{(100)\left(200\times 10^{-6}\right)} = \frac{1}{.02} = 50$$

$$\frac{di}{dt} + 50i = 0$$

$$e^{\int 50dt} = e^{50t}$$

$$i(t) = Ke^{-50t}$$

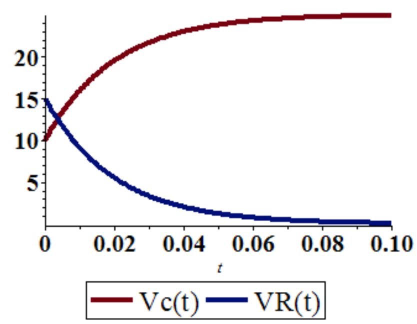
$$i(0) = 0.15 \quad\rightarrow\quad 0.15 = K$$

$$i(t) = 0.15e^{-50t}$$

$$v_R = Ri(t) = 15e^{-50t}$$

$$v_C = v_s - v_R$$

$$= 25 - 15e^{-50t}$$



Exercise

Find the steady-state solution $q_p(t)$ and the steady-state current in and *LRC*–series circuit when the source voltage is $E(t) = E_0 \sin \omega t$

Solution

$$Lq'' + Rq' + \frac{1}{C}q = E_0 \sin \omega t$$

$$L\lambda^2 + R\lambda + \frac{1}{C} = 0 \quad\rightarrow\quad \lambda_{1,2} = \frac{-R \pm \sqrt{R^2 - \frac{4L}{C}}}{2L} = \frac{-R\sqrt{C} \pm \sqrt{R^2C - 4L}}{2L\sqrt{C}}$$

$$q_p = A\cos \omega t + B\sin \omega t$$

$$q'_p = -\omega A\sin \omega t + \omega B\cos \omega t$$

$$q_p'' = -\omega^2 A\cos\omega t - \omega^2 B\sin\omega t$$

$$-\omega^2 LA\cos\omega t - \omega^2 LB\sin\omega t - \omega RA\sin\omega t + \omega RB\cos\omega t + \frac{1}{C}A\cos\omega t + \frac{1}{C}B\sin\omega t = E_0 \sin\omega t$$

$$\begin{cases} \cos\omega t & \left(-\omega^2 L + \frac{1}{C}\right)A + \omega RB = 0 \\ \sin\omega t & -\omega RA + \left(\frac{1}{C} - \omega^2 L\right)B = E_0 \end{cases}$$

$$\Delta = \begin{vmatrix} \frac{1}{C} - \omega^2 L & \omega R \\ -\omega R & \frac{1}{C} - \omega^2 L \end{vmatrix} = \frac{1}{C^2} - \frac{2\omega^2 L}{C} + \omega^4 L^2 + \omega^2 R^2 = \frac{1}{C^2}\left(1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2\right)$$

$$\Delta_A = \begin{vmatrix} 0 & \omega R \\ E_0 & \frac{1}{C} - \omega^2 L \end{vmatrix} = \omega RE_0 \quad \Delta_B = \begin{vmatrix} \frac{1}{C} - \omega^2 L & 0 \\ -\omega R & E_0 \end{vmatrix} = \left(\frac{1}{C} - \omega^2 L\right)E_0$$

$$A = \frac{\omega RC^2 E_0}{1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2} \qquad B = \frac{C(1 - \omega LC)E_0}{1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2}$$

Therefore, the steady-state charge is:

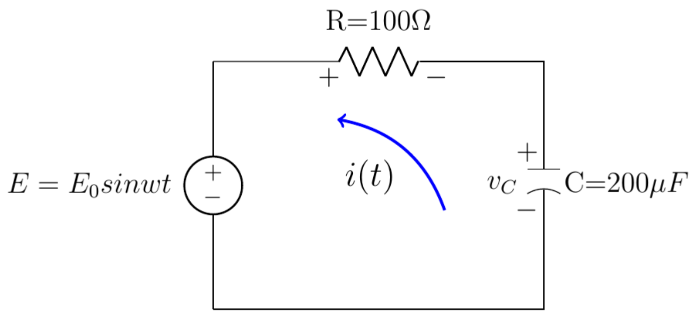
$$\boxed{q_p(t) = \frac{CE_2}{1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2}\left(\omega RC\cos\omega t + (1 - \omega LC)\sin\omega t\right)}$$

The steady-state current is: $\quad i_p(t) = q_p'(t)$

$$\boxed{i_p(t) = \frac{CE_2}{1 - 2\omega^2 LC + \omega^4 L^2 C^2 + \omega^2 R^2 C^2}\left(-\omega^2 RC\sin\omega t + \left(\omega - \omega^2 LC\right)\cos\omega t\right)}$$

Exercise

Consider the given *RC*-circuit with impressed *emf* is $E = E_0 \sin\omega t \ V$. If no initial current is flowing at $t = 0$, find the current $i(t)$ for all $t > 0$.



Solution

Given: $\quad R = 100\ \Omega, \quad C = 200\ \mu F, \quad E = E_0 \sin\omega t \ V, \quad i(0^+) = 0$

$$Ri + \frac{1}{C}q = E$$

$$\frac{d}{dt}\left(Ri + \frac{1}{C}q = E_0 \sin \omega t\right)$$

$$R\frac{di}{dt} + \frac{1}{C}\frac{dq}{dt} = \omega E_0 \cos \omega t \qquad i = \frac{dq}{dt}$$

$$100\frac{di}{dt} + \frac{1}{2\times 10^{-3}} i = \omega E_0 \cos \omega t$$

$$\frac{di}{dt} + 5i = \frac{\omega E_0}{100}\cos \omega t$$

		$\int \cos \omega t$
+	e^{5t}	$\frac{1}{\omega}\sin \omega t$
−	$5e^{5t}$	$-\frac{1}{\omega^2}\cos \omega t$
+	$25e^{5t}$	

$$e^{\int 5dt} = e^{5t}$$

$$\int e^{5t}\left(\frac{\omega E_0}{100}\cos \omega t\right)dt = \frac{\omega E_0}{100}\int e^{5t}\cos \omega t\, dt$$

$$\int e^{5t}\cos \omega t\, dt = e^{5t}\left(\frac{1}{\omega}\sin \omega t + \frac{5}{\omega^2}\cos \omega t\right) - \frac{25}{\omega^2}\int e^{5t}\cos \omega t\, dt$$

$$\frac{\omega^2+25}{\omega^2}\int e^{5t}\cos \omega t\, dt = \frac{1}{\omega^2}e^{5t}(\omega \sin \omega t + 5\cos \omega t)$$

$$\int e^{5t}\cos \omega t\, dt = \frac{1}{\omega^2+25}e^{5t}(\omega \sin \omega t + 5\cos \omega t)$$

$$\int e^{5t}\left(\frac{\omega E_0}{100}\cos \omega t\right)dt = \frac{1}{100}\frac{\omega E_0}{\omega^2+25}e^{5t}(\omega \sin \omega t + 5\cos \omega t)$$

$$i(t) = \frac{1}{e^{5t}}\left(\frac{1}{100}\frac{\omega E_0}{\omega^2+25}e^{5t}(\omega \sin \omega t + 5\cos \omega t) + K\right)$$

$$= \frac{\omega E_0}{100\left(\omega^2+25\right)}(\omega \sin \omega t + 5\cos \omega t) + \frac{K}{e^{5t}}$$

$$i(0) = 0 \quad \to \frac{\omega E_0}{20\left(\omega^2+25\right)} + K = 0 \quad K = -\frac{\omega E_0}{20\left(\omega^2+25\right)}$$

$$i(t) = \frac{\omega E_0}{100\left(\omega^2+25\right)}(\omega \sin \omega t + 5\cos \omega t) - \frac{\omega E_0}{20\left(\omega^2+25\right)}e^{-5t}$$

$$= \frac{\omega E_0}{20\left(\omega^2+25\right)}\left(\frac{\omega}{5}\sin \omega t + \cos \omega t - e^{-5t}\right)$$
