 since $0 < a < 1 \Rightarrow P_1$ is true.

Assume that P_k is true: $a^k < a^{k-1}$; we need to prove that P_{k+1} : $a^{k+1} < a^k$ is true

$$\begin{array}{ccc} a^k < a^{k-1} & \to & a^k \cdot a < a^{k-1} \cdot a \\ & & & a^{k+1} < a^k & \checkmark & & P_{k+1} \ \ \text{is also true}. \end{array}$$

Prove that the statement by mathematical induction: If $n \ge 4$, then $n! > 2^n$

Solution

For
$$n = 4 \Rightarrow 4! > 2^4 \Rightarrow 24 > 16 \checkmark \Rightarrow P_1$$
 is true.

: By the mathematical induction, the proof is completed.

Exercise

Prove that the statement by mathematical induction: $3^n > 2n+1$ if $n \ge 2$

Solution

For
$$n = 2 \Rightarrow 3^2 > 2(2) + 1 \Rightarrow 9 > 5 \checkmark \Rightarrow P_1$$
 is true.

Assume that
$$P_k$$
 is true: $3^k > 2k+1$; we need to prove that $P_{k+1}: 3^{k+1} > 2(k+1)+1$ is true $3^k > 2k+1 \implies 3^k \cdot 3 > (2k+1) \cdot 3$
$$3^{k+1} > 6k+3$$

$$> 2k+2+1$$

$$= 2(k+1)+1 \quad \checkmark \quad \text{Thus, } P_{k+1} \text{ is also true.}$$

: By the mathematical induction, the proof is completed.

Exercise

Prove that the statement by mathematical induction: $2^n > n^2$ for n > 4 **Solution**

For
$$n = 5 \implies 2^5 > 5^2 \implies 32 > 25 \checkmark \implies P_1$$
 is true.

Assume that
$$P_k$$
 is true: $2^k > k^2$; we need to prove that $P_{k+1}: 2^{k+1} > (k+1)^2$ is true $2^k > k^2 \implies 2^k \cdot 2 > k^2 \cdot 2$
$$2^{k+1} > 2k^2 \qquad k < k+1 \implies k^2 > 2k+1$$
 $> (k+1)^2 \checkmark$ Thus, P_{k+1} is also true

Prove that the statement by mathematical induction:

$$4^n > n^4$$
 for $n \ge 5$

Solution

For
$$n = 5 \implies 4^5 > 5^4 \implies 1024 > 625 \checkmark \implies P_1$$
 is true.

Assume that P_k is true: $4^k > k^4$; we need to prove that $P_{k+1} : 4^{k+1} > (k+1)^4$ is true

$$4^k > k^4 \implies 4^k \cdot 4 > k^4 \cdot 4$$

$$4^{k+1} > 4k^4 \qquad k < k+1 \implies k^2 > 2k+1$$

$$> (k+1)^4 \checkmark \text{ Thus, } P_{k+1} \text{ is also true}$$

: By the mathematical induction, the proof is completed.

Exercise

A pile of *n* rings, each smaller than the one below it, is on a peg on board. Two other pegs are attached to the board. In the game called the Tower of Hanoi puzzle, all the rings must moved, one at a time, to a different peg with no ring ever placed on top of a smaller ring. Find the least number of moves that would be required. Prove your result by mathematical induction.

Solution

With 1 ring, 1 move is required.

With 2 rings, 3 moves are required \Rightarrow 3 = 2+1

With 3 rings, 7 moves are required \Rightarrow 7 = 2² + 2 + 1

With *n* rings, $2^{n-1} + \dots + 2^2 + 2^1 + 2^0 = 2^n - 1$ moves are required

For
$$n = 1 \implies 2^0 = 2^1 - 1 = 1$$
 $\checkmark \implies P_1$ is true.

Assume that
$$P_k$$
 is true: $2^{k-1} + \dots + 2^2 + 2^1 + 2^0 = 2^k - 1$

$$2^{k} + 2^{k-1} + \dots + 2^{2} + 2^{1} + 1 = 2^{k+1} - 1$$

$$2^{k} + 2^{k-1} + \dots + 2^{2} + 2^{1} + 1 = 2^{k} + 2^{k} - 1$$

$$= 2 \cdot 2^{k} - 1$$

$$= 2^{k+1} - 1$$
