# Section 4.2 – Line Integrals

# **Definition**

If f is defined on a curve C given parametrically by  $\vec{r}(t) = g(t)\hat{i} + h(t)\hat{j} + k(t)\hat{k}$ ,  $a \le t \le b$ , then the line integral of f over C is

$$\int_{C} f(x, y, z) ds = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_{k}, y_{k}, z_{k}) \Delta s_{k}$$

Provided this limit exists.

## How to Evaluate a Line Integral

- **1.** Find a smooth parametrization of C,  $\vec{r}(t) = g(t)\hat{i} + h(t)\hat{j} + k(t)\hat{k}$ ,  $a \le t \le b$
- 2. aluate the integral as

$$\int_{C} f(x, y, z) ds = \int_{a}^{b} f(g(t), h(t), k(t)) |\vec{v}(t)| dt$$

# Example

Integrate  $f(x, y, z) = x - 3y^2 + z$  over the line segment C joining the origin to the point (1, 1, 1).

#### **Solution**

Assume that: 
$$\vec{r}(t) = t\hat{i} + t\hat{j} + t\hat{k}$$
,  $0 \le t \le 1$ 

$$|\vec{v}(t)| = |\hat{i} + \hat{j} + \hat{k}|$$

$$= \sqrt{1^2 + 1^2 + 1^2}$$

$$= \sqrt{3} \neq 0 \quad \text{(The parameterization is smooth)}$$

$$\int_{C} f(x, y, z) ds = \int_{0}^{1} f(t, t, t) (\sqrt{3}) dt$$

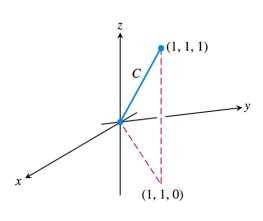

$$= \sqrt{3} \int_{0}^{1} (t - 3t^{2} + t) dt$$

$$= \sqrt{3} \int_{0}^{1} (2t - 3t^{2}) dt$$

$$= \sqrt{3} \left[ t^{2} - t^{3} \right]_{0}^{1}$$

$$= \sqrt{3} (1 - 1)$$

$$= 0$$

### **Example**

Integrate  $f(x, y, z) = x - 3y^2 + z$  over  $C_1 \cup C_2$  using the path the origin to the point (1, 1, 1).

#### Solution

$$C_{1}: \vec{r}_{1}(t) = t\hat{i} + t\hat{j} \quad 0 \le t \le 1 \qquad |\vec{v}_{1}| = \sqrt{1^{2} + 1^{2}} = \sqrt{2}$$

$$C_{2}: \vec{r}(t) = \hat{i} + \hat{j} + t\hat{k} \quad 0 \le t \le 1 \quad |\vec{v}_{2}| = \sqrt{0^{2} + 0^{2} + 1^{2}} = 1$$

$$\int_{C_{1} \cup C_{2}} f(x, y, z) ds = \int_{C_{1}} f(x, y, z) ds + \int_{C_{2}} f(x, y, z) ds$$

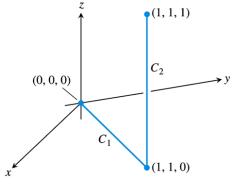

$$= \int_{0}^{1} f(t, t, 0) \sqrt{2} dt + \int_{0}^{1} f(t, t, 0) dt$$

$$= \sqrt{2} \int_{0}^{1} (t - 3t^{2} + 0) dt + \int_{0}^{1} (1 - 3t) dt$$

$$= \sqrt{2} \left[ \frac{1}{2} t^{2} - t^{3} \right]_{0}^{1} + \left[ -2t + \frac{1}{2} t^{2} \right]_{0}^{1}$$

$$= \sqrt{2} \left( \frac{1}{2} - 1 \right) + \left( -2 + \frac{1}{2} \right)$$

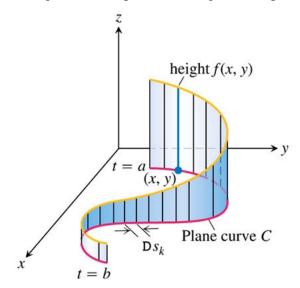

$$= -\frac{\sqrt{2}}{2} - \frac{3}{2}$$

> The value of the line integral along a path joining two points can change if you change the path between them.

### Line Integrals in the Plane

There is an interesting geometric interpretation for line integrals in the plane. If C is a smooth curve in the xy-plane parametrized by  $\vec{r}(t) = x(t)\hat{i} + y(t)\hat{j} + z(t)\hat{k}$ ,  $a \le t \le b$ , we generate a cylindrical surface by moving a straight line along C orthogonal to the plane, holding the line parallel to the z-axis.

The cylinder cuts through the surface, forming a curve on it. The part of the cylindrical surface that lies beneath the surface curve and above the *xy*-plane is like a *winding wall* or *fence* standing on the curve *C* and orthogonal to the plane.

$$\int_{C} f \, ds = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_{k}, y_{k}) \Delta s_{k}$$

Where  $\Delta s_k \to 0$  as  $n \to \infty$ , we see that he line integral  $\int_C f \, ds$  is the area of the wall.

# Line Integrals with Respect to the xyz Coordinates

$$\int_{C} M(x, y, z) dx = \int_{a}^{b} M(g(t), h(t), k(t)) g'(t) dt$$

$$\int_{C} N(x, y, z) dy = \int_{a}^{b} N(g(t), h(t), k(t)) h'(t) dt$$

$$\int_{C} P(x, y, z) dz = \int_{a}^{b} P(g(t), h(t), k(t)) k'(t) dt$$

## Example

Evaluate the line integral  $\int_C -ydx + zdy + 2xdz$ , where C is the helix

$$\vec{r}(t) = (\cos t)\hat{i} + (\sin t)\hat{j} + t\hat{k} \quad 0 \le t \le 2\pi$$

#### **Solution**

$$x = \cos t$$
,  $y = \sin t$ ,  $z = t$   
 $dx = (-\sin t)dt$ ,  $dy = (\cos t)dt$ ,  $dz = dt$ 

$$\int_{C} -ydx + zdy + 2xdz = \int_{0}^{2\pi} \left[ (-\sin t)(-\sin t) + t\cos t + 2\cos t \right] dt$$

$$= \int_{0}^{2\pi} \left( \sin^{2} t + t\cos t + 2\cos t \right) dt$$

$$= \int_{0}^{2\pi} \left( \frac{1}{2} - \frac{1}{2}\cos 2t + t\cos t + 2\cos t \right) dt$$

$$= \left[ \frac{1}{2}t - \frac{1}{4}\sin 2t + (t\sin t + \cos t) + 2\sin t \right]_{0}^{2\pi}$$

$$= \left( \frac{1}{2}(2\pi) + 1 \right) - (1)$$

$$= \pi + 1 - 1$$

$$= \pi$$
