Section R.2 – Integration

Definition of Antiderivative

A Function F is an Antiderivative of a function f if for every x in the domain of f, it follows that F'(x) = f(x)

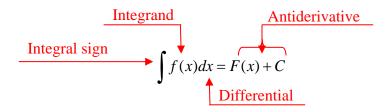

Notation for Antiderivatives and indefinite integrals

The notation

$$\int f(x)dx = F(x) + C$$

where C is an arbitrary constant, means that F is an Antiderivative of f. That is F'(x) = f(x) for all x in the domain of f.

$$\int f(x)dx$$
 Indefinite integral

Basic Integration Rules

$$\int kdx = kx + C$$

$$\int kf(x)dx = k \int f(x)dx$$

$$\int [f(x) + g(x)]dx = \int f(x)dx + \int g(x)dx$$

$$\int [f(x) - g(x)]dx = \int f(x)dx - \int g(x)dx$$

$$\int x^n dx = \frac{x^{n+1}}{n+1} + C \qquad n \neq -1$$

The General Power Rule

The Simple Power Rule is given by:

$$\int x^n dx = \frac{x^{n+1}}{n+1} + C \qquad n \neq -1$$

$$\int \left(x^2 + 1\right)^3 \underbrace{2x dx}_{\text{du}} = \int u^3 du$$

$$= \frac{u^4}{4} + C$$

General Power Rule for Integration

If u is a differentiable function of x, then

$$\int u^n \frac{du}{dx} dx = \int u^n du = \frac{u^{n+1}}{n+1} + C \qquad n \neq -1$$

Example

Find each indefinite integral.

$$\int 5x dx = \int 5x^{1} dx$$
$$= 5\frac{x^{1+1}}{1+1} + C$$
$$= \frac{5}{2}x^{2} + C$$

$$\int \sqrt[3]{x} dx = \int x^{1/3} dx$$

$$= \frac{x^{1/3+1}}{1/3+1} + C$$

$$= \frac{x^{4/3}}{4/3} + C$$

$$= \frac{3}{4} x^{4/3} + C \qquad or \qquad = \frac{3}{4} x^{3/3} + C$$

Using the Exponential Rule

Let *u* be a differentiable function of *u*

$$\int e^{u} du = e^{u} + C$$

General Exponential Rule

Example

Find the indefinite integral $\int e^{2x+3} dx$

Solution

Let
$$u = 2x + 3 \rightarrow du = 2dx$$

$$\int e^{2x+3} dx = \int e^{u} \frac{1}{2} du$$

$$= \frac{1}{2} \int e^{u} du$$

$$= \frac{1}{2} e^{u} + C$$

$$= \frac{1}{2} e^{2x+3} + C$$

Using the Log Rule

Let u be a differentiable function of x.

$$\int \frac{du/dx}{u}dx = \int \frac{1}{u}du = \ln|u| + C$$

General Logarithmic Rule

Example

Find the indefinite integral $\int \frac{1}{4x+1} dx$

Let
$$u = 4x + 1 \rightarrow du = 4dx \rightarrow \frac{1}{4}du = dx$$

$$\int \frac{1}{4x+1} dx = \int \frac{1}{u} \frac{1}{4} du$$

$$= \frac{1}{4} \int \frac{1}{u} du$$

$$= \frac{1}{4} \ln|u| + C$$

$$= \frac{1}{4} \ln|4x+1| + C$$

Integration by Parts

Let u and v be differentiable functions of x.

$$\int u dv = uv - \int v du$$

Guidelines for integration by Parts

- 1. Let dv be the most complicated portion of the integrand that fits a basic integration formula. Let u be the remaining factor.
- 2. Let u be the portion of the integrand whose derivative is a function simpler than u. Let dv be the remaining factor.

Example

Find
$$\int x \cos x dx$$

Solution

Let:

$$u = x dv = \cos x dx$$

$$du = dx v = \int dv = \int \cos x dx = \sin x$$

$$\int u dv = uv - \int v du$$

$$\int x \cos x dx = x \sin x - \int \sin x dx$$

$$= x \sin x + \cos x + C$$

Example

Evaluate
$$\int x^2 e^x dx$$

$$f(x) = x^2$$
 and $g(x) = e^x$
$$\int x^2 e^x dx = \underline{x^2 e^x - 2xe^x + 2e^x + C}$$

	derivative	$\int e^{x} dx$
(+)	x^2	e^{x}
(-)	2 <i>x</i>	\rightarrow e^{x}
(+)	2	\rightarrow e^{x}
	0	

Particular Solutions

In many applications of integrations, we are given enough information to determine a particular solution. To do this, we need to know the value of F(x) for one value of x. This information is called an initial condition.

Example

Solve the differential equation: $y' = te^t$ that satisfies y(0) = 2

Solution

Integration by part:
$$\int u dv = uv - \int v du$$

$$\begin{cases} u = t \Rightarrow du = dt \\ dv = e^t dt \Rightarrow v = e^t \end{cases}$$

$$y = te^t - \int e^t dt$$

$$= te^t - e^t + C$$

$$y(0) = (0)e^0 - e^0 + C = 2$$

$$-1 + C = 2$$

$$C = 3$$

$$y(t) = e^t (t - 1) + 3$$

Example

Solve the differential equation: $y' = \frac{1}{x}$ that satisfies y(1) = 3

$$y = \int \frac{1}{x} dx$$

$$= \ln|x| + C$$

$$y(1) = \ln|1| + C = 3$$

$$C = 3$$

$$y(x) = \ln x + 3 \quad \text{with } x > 0$$

Example

Suppose a ball thrown into the air with initial velocity $v_0 = 20 \, ft \, / \sec$. Assuming the ball thrown from a height of $x_0 = 6 \, ft$, how long does it take for the ball to hit the ground?

$$\frac{dv}{dt} = -g \Rightarrow dv = -gdt$$

$$v(t) = -gt + C_1$$

$$v(t = 0) = -g(0) + C_1 = 20$$

$$C_1 = 20$$

$$v(t) = -32t + 20$$

$$\frac{dx}{dt} = v \Rightarrow dx = vdt$$

$$\int dx = \int vdt$$

$$x(t) = \int (-32t + 20)dt$$

$$= -16t^2 + 20t + C_2$$

$$x(t = 0) = -16(0)^2 + 20(0) + C_2 = 6$$

$$C_2 = 6$$

$$x(t) = -16t^2 + 20t + 6$$

Theorem - The Fundamental Theorem of Calculus, P-2

If f is continuous at every point in [a, b], then F is any antiderivative of f on [a, b], then

$$\int_{a}^{b} f(x)dx = F(b) - F(a)$$

Example

a)
$$\int_0^{\pi} \cos x \, dx = \sin x \Big|_0^{\pi}$$
$$= \sin \pi - \sin 0$$
$$= 0$$

b)
$$\int_{-\frac{\pi}{4}}^{0} \sec x \tan x \, dx = \sec x \begin{vmatrix} 0 \\ -\frac{\pi}{4} \end{vmatrix}$$
$$= \sec 0 - \sec \left(-\frac{\pi}{4}\right)$$
$$= \frac{1 - \sqrt{2}}{2}$$

c)
$$\int_{1}^{4} \left(\frac{3}{2}\sqrt{x} - \frac{4}{x^{2}}\right) dx = \left[x^{3/2} + \frac{4}{x}\right]_{1}^{4}$$
$$= \left((4)^{3/2} + \frac{4}{4}\right) - \left((1)^{3/2} + \frac{4}{1}\right)$$
$$= (9) - (5)$$
$$= 4$$

Exercises Section R.2 – Integration

Find each indefinite integral.

$$1. \quad \int \frac{x+2}{\sqrt{x}} dx$$

$$5. \quad \int \sqrt{x(x+1)} dx$$

9.
$$\int (7-3x-3x^2)(2x+1) dx$$

$$2. \quad \int 4y^{-3} dy$$

$$6. \quad \int (1+3t)t^2 dt$$

$$10. \int xe^{2x} dx$$

3.
$$\int (x^3 - 4x + 2)dx$$

$$7. \quad \int \frac{x^2 - 5}{x^2} dx$$

11.
$$\int x \ln x dx$$

$$4. \quad \int \left(\sqrt[4]{x^3} + 1\right) dx$$

8.
$$\int (-40x + 250) dx$$

12.
$$\int (x^2 - 2x + 1)e^{2x} dx$$

 $13. \int e^{2x} \cos 3x dx$

Find the general solution of the differential equation

14.
$$y' = 2t + 3$$

18.
$$y' = 5x\sqrt{x^2 - 1}$$

21.
$$y' = \frac{1}{6x-5}$$

15.
$$y' = 3t^2 + 2t + 3$$

19.
$$y' = x\sqrt{x^2 + 4}$$

22.
$$y' = \frac{x^2 + 2x + 3}{x^3 + 3x^2 + 9x + 1}$$

16.
$$y' = \sin 2t + 2\cos 3t$$

20.
$$y' = (2x+1)e^{x^2+x}$$

23.
$$y' = \frac{1}{x(\ln x)^2}$$

 $17. \quad y' = x^3 (3x^4 + 1)^2$

Evaluate the integrals

24.
$$\int_{-2}^{2} \left(x^3 - 2x + 3 \right) dx$$

$$29. \quad \int_{-3}^{-1} \frac{y^5 - 2y}{y^3} dy$$

$$25. \quad \int_0^1 \left(x^2 + \sqrt{x}\right) dx$$

30.
$$\int_{1}^{8} \frac{\left(x^{1/3}+1\right)\left(2-x^{2/3}\right)}{x^{1/3}} dx$$

$$26. \quad \int_0^{\pi/3} 4\sec u \tan u \ du$$

$$31. \quad \int_0^1 (2t+3)^3 dt$$

$$27. \quad \int_{\pi/4}^{3\pi/4} \csc\theta \cot\theta d\theta$$

32.
$$\int_{-1}^{1} r \sqrt{1-r^2} \ dr$$

28.
$$\int_{-\pi/3}^{-\pi/4} \left(4\sec^2 t + \frac{\pi}{t^2} \right) dt$$

- **33.** Find the general solution of F'(x) = 4x + 2, and find the particular solution that satisfies the initial condition F(1) = 8.
- **34.** Find the general solution of the differential equation: $y' = t \cos 3t$
- **35.** A ball is thrown into the air from an initial height of 6 m with an initial velocity of 120 m/s. What will be the maximum height of the ball and at what time will this event occur?
- **36.** Derive the position function if a ball is thrown upward with initial velocity of 32 *ft* per *second* from an initial height of 48 *ft*. When does the ball hit the ground? With what velocity does the ball hit the ground?
