# **Lecture One** – Limits and Derivatives

# Section 1.1 – Idea of Limits

#### Position Function

An object that is falling or vertically projected into the air has its height above the ground, s(t), in feet, given by

$$s(t) = -16t^2 + v_0 t + s_0$$

 $v_0$  is the original velocity (initial velocity) of the object, in *feet* per *second* 

t is the time that the object is in motion, in second

 $s_0$  is the original height (initial height) of the object, in *feet* 

The average rate is given by:  $\frac{\Delta s}{\Delta t}$ 

#### Example

A rock breaks loose from the top of a tall cliff. What is its average speed

- a) During the first 2 sec of fall?
- b) During the 1-sec interval between second 1 and second 2?

#### Solution

Since the rock falls free (*down*) without any initial velocity or height.  $\Rightarrow y(t) = 16t^2$ 

1

a) For the first 2 sec: Average speed = 
$$\frac{\Delta y}{\Delta t}$$
  
=  $\frac{y(2) - y(0)}{2 - 0}$   
=  $\frac{16(2)^2 - 16(0)^2}{2}$   
=  $\frac{64}{2}$   
= 32 ft/sec

b) From 1 sec to 2 sec: Average speed = 
$$\frac{y(2) - y(1)}{2 - 1}$$
  
=  $\frac{16(2)^2 - 16(1)^2}{1}$   
=  $\frac{48 \text{ ft/sec}}{1}$ 

Find the speed of a falling rock  $(y(t) = 16t^2)$  over a time interval  $[t_0, t_0 + h]$ . Then find the average speed at 1 sec and 2 sec.

#### **Solution**

$$\frac{\Delta y}{\Delta t} = \frac{16(t_0 + h)^2 - 16(t_0)^2}{(t_0 + h) - t_0}$$

$$= \frac{16(t_0^2 + 2ht_0 + h^2) - 16t_0^2}{t_0 + h - t_0}$$

$$= \frac{16t_0^2 + 32ht_0 + 16h^2 - 16t_0^2}{h}$$

$$= 32\frac{ht_0}{h} + 16\frac{h^2}{h}$$

$$= 32t_0 + 16h$$

If 
$$t_0 = 1$$

$$\frac{\Delta y}{\Delta t} = 32(1) + 16h$$
$$= 32 + 16h \mid$$

The average speed has the limiting value  $32 \, ft/sec$  as h approaches 0.

If 
$$t_0 = 2$$

$$\frac{\Delta y}{\Delta t} = 32(2) + 16h$$

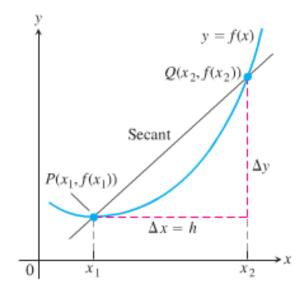

$$= 64 + 16h$$

The average speed has the limiting value  $64 \, ft/sec$  as h approaches 0.

#### **Average Rates of Changes and Secant Lines**

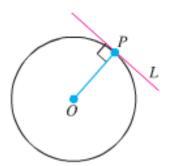

The average rate of change of y = f(x) with respect to x over the interval  $[x_1, x_2]$  is

$$\frac{\Delta y}{\Delta x} = \frac{f\left(x_2\right) - f\left(x_1\right)}{x_2 - x_1}$$
$$= \frac{f\left(x_1 + h\right) - f\left(x_1\right)}{h}, \quad h \neq 0$$

## Defining the Slope of a Curve

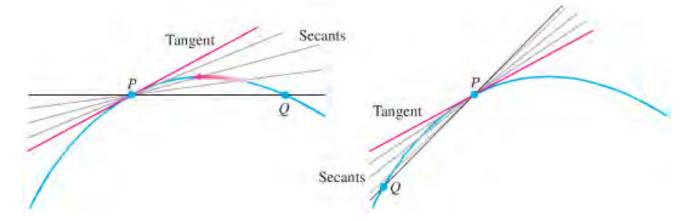

The slope of a line is the rate at which it rises or falls.

To define the tangency for general curves, we need an approach that makes the behavior of the secants through P and points Q as Q moves toward P along the curve:

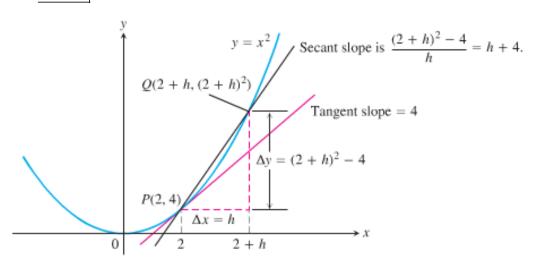

- 1. Find the slope of the secant PQ.
- 2. Investigate the limiting value of the slope as Q approaches P along the curve.
- **3.** If the limit exists, take it to be the slope of the curve at *P* and define the tangent to the curve at *P* to be the line through *P* with this slope.

$$m_{\text{tan}} = \lim_{t \to a} \frac{f(t) - f(a)}{t - a}$$

Find the slope of the parabola  $y = x^2$  at the point P(2, 4). Write an equation for the tangent to the parabola at this point.

Secant slope 
$$= \frac{\Delta y}{\Delta x} = \frac{f(x_1 + h) - f(x_1)}{h}$$
$$= \frac{f(2+h) - f(2)}{h}$$
$$= \frac{(2+h)^2 - 2^2}{h}$$
$$= \frac{4+4h+h^2-4}{h}$$
$$= \frac{4h}{h} + \frac{h^2}{h}$$
$$= 4+h \mid$$

As Q approaches P, h approaches 0. Then the secant slope  $h+4 \rightarrow 4 = slope$ 

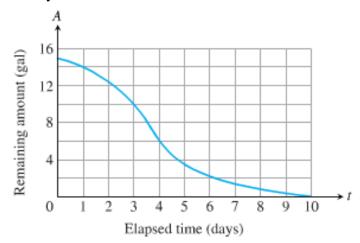

$$y = m(x - x_1) + y_1$$
$$y = 4(x - 2) + 4$$
$$y = 4x - 4$$

# **Exercises** Section 1.1 – Idea of Limits

- 1. Find the average rate of change of the function  $f(x) = x^3 + 1$  over the interval [2, 3]
- 2. Find the average rate of change of the function  $f(x) = x^2$  over the interval [-1, 1]
- 3. Find the average rate of change of the function  $f(t) = 2 + \cos t$  over the interval  $[-\pi, \pi]$
- **4.** Find the slope of  $y = x^2 3$  at the point P(2, 1) and an equation of the tangent line at this P.
- 5. Find the slope of  $y = x^2 2x 3$  at the point P(2, -3) and an equation of the tangent line at this P.
- **6.** Find the slope of  $y = x^3$  at the point P(2, 8) and an equation of the tangent line at this P.
- 7. Make a table of values for the function  $f(x) = \frac{x+2}{x-2}$  at the points

$$x = 1.2$$
,  $x = \frac{11}{10}$ ,  $x = \frac{101}{100}$ ,  $x = \frac{1001}{1000}$ ,  $x = \frac{10001}{10000}$ , and  $x = 1$ 

- a) Find the average rate of change of f(x) over the intervals [1, x] for each  $x \ne 1$  in the table
- b) Extending the table if necessary, try to determine the rate of change of f(x) at x = 1.
- **8.** The accompanying graph shows the total amount of gasoline A in the gas tank of an automobile after being driven for *t* days.

a) Estimate the average rate of gasoline consumption over the time intervals

b) Estimate the instantaneous rate of gasoline consumption over the time t = 1, t = 4, and t = 8

6

# **Section 1.2 – Definitions / Techniques of Limits**

### **Definition of the Limit of a Function**

If f(x) becomes arbitrary close to a single number L as x approaches  $x_0$  from either side, then

$$\lim_{x \to x_0} f(x) = L$$

Which is read as "the limit of f(x) as x approaches  $x_0$  is L."

Notation	Terminology		
$x \rightarrow a^{-}$	$\boldsymbol{x}$ approaches $\boldsymbol{a}$ from the left (through values $\boldsymbol{less}$ than $\boldsymbol{a}$ )		
$x \rightarrow a^+$	$\boldsymbol{x}$ approaches $\boldsymbol{a}$ from the right (through values <i>greater</i> than $a$ )		

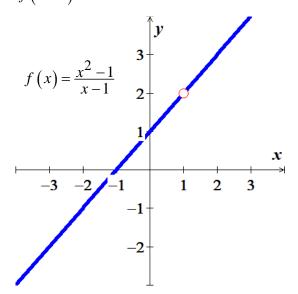

### **Example**

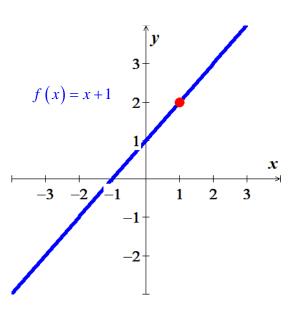

How does the function  $f(x) = \frac{x^2 - 1}{x - 1}$  behave near x = 1?

$$f(x) = \frac{(x-1)(x+1)}{x-1}$$
$$= x+1 \quad for \quad x \neq 1$$

For 
$$x = 1$$
:

$$f(x=1)=1+1=2$$

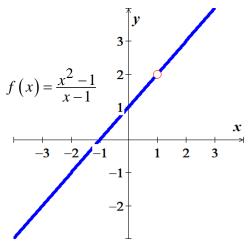

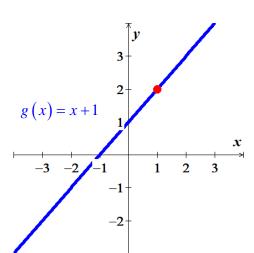

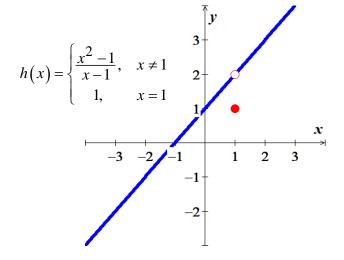

x	.9	.99	.999	1.001	1.01	1.1
f(x)	1.9	1.99	1.999	2.001	2.01	2.1

$$\lim_{x \to 1} f(x) = \lim_{x \to 1} \frac{x^2 - 1}{x - 1}$$

$$= 2$$

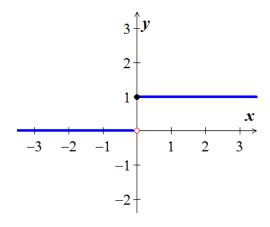

Discuss the behavior of the following function as  $x \to 0$ .

$$U(x) = \begin{cases} 0, & x < 0 \\ 1, & x \ge 0 \end{cases}$$

The unit step function U(x) has no limit as  $x \to 0$ , it jumps, because the values jump at x = 0. To the left of zero  $\left( \text{negative value } \mathbf{0}^{-} \right) U(x) = 0$ . For the positive values of x close to zero  $\left( \mathbf{0}^{+} \right) U(x) = 1$ 

#### **One-Sided Limits**

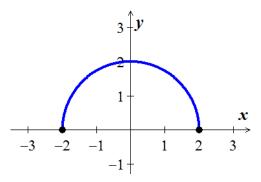

To have a limit L as x approaches c, a function f must be defined on **both sides** of c and its values f(x) must approach L as x approaches c from either side. Because of this, ordinary limits are called **two-sided**. If f fails to have two-sided limit at c, it may still have one-sided limit.

If the approach is from the *right*, the limit is a *right-hand limit*.  $\lim_{x\to c^+} f(x) = L$ 

If the approach is from the *left*, the limit is a *left-hand limit*.  $\lim_{x\to c^-} f(x) = M$ 

## **Example**

The domain of  $f(x) = \sqrt{4 - x^2}$  is [-2, 2]; its graph is the semicircle.

We have:  $\lim_{x \to -2^{+}} \sqrt{4 - x^{2}} = 0$  and  $\lim_{x \to 2^{-}} \sqrt{4 - x^{2}} = 0$ 

The function doesn't have a left-hand limit at x = -2 or a right-hand limit at x = 2. It does not have ordinary two-sided limits at either -2 or 2.

## **Theorem**

A function f(x) has a limit as x approaches c if and only if it has left-hand and right-hand limits there and these one-sided limits are equal:

$$\lim_{x \to c} f(x) = L \iff \lim_{x \to c^{-}} f(x) = L \quad and \quad \lim_{x \to c^{+}} f(x) = L$$

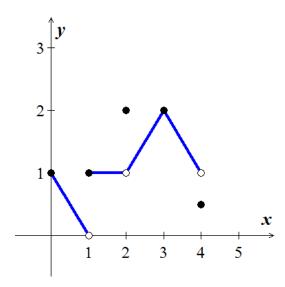

#### **Properties of Limits**

Constant function 
$$(f(x) = k)$$
:  $\lim_{x \to x_0} f(x) = \lim_{x \to x_0} k = k$ 

**Identity function** 
$$(f(x) = x)$$
: 
$$\lim_{x \to x_0} f(x) = \lim_{x \to x_0} x = x_0$$

## **Example**

Given the function graphed:

At 
$$x = 0$$
:  $\lim_{x \to 0^+} f(x) = 1$ 

 $\lim_{x\to 0^{-}} f(x) \quad and \quad \lim_{x\to 0} f(x) \text{ don't exist. The function is not defined to the left of } x = 0$ 

At 
$$x = 1$$
:  $\lim_{x \to 1^{-}} f(x) = 0$   $\lim_{x \to 1^{+}} f(x) = 1$ 

 $\lim_{x\to 1} f(x)$  doesn't exist. The right-hand and left-hand limits are not equal.

At 
$$x = 2$$
:  $\lim_{x \to 2^{-}} f(x) = 1$   $\lim_{x \to 2^{+}} f(x) = 1$   $\lim_{x \to 2} f(x) = 2$  even though  $f(2) = 2$ 

At 
$$x = 3$$
:  $\lim_{x \to 3^{-}} f(x) = \lim_{x \to 3^{+}} f(x) = \lim_{x \to 3} f(x) = 2$ 

At 
$$x = 4$$
:  $\lim_{x \to 4^{-}} f(x) = 1$  even though  $f(4) \neq 1$ 

$$\lim_{x \to 4^{+}} f(x) \quad and \quad \lim_{x \to 4} f(x) \text{ do not exist.}$$

The function is not defined to the right of x = 4

## **Definitions**

We say that 
$$f(x)$$
 has right-hand limit  $L$  at  $x_0$  and  $\lim_{x \to x_0^+} f(x) = L$ 

If for every number  $\varepsilon > 0$  there exists a corresponding number  $\delta > 0$  such that for all x

$$x_0 < x < x_0 + \delta \implies |f(x) - L| < \varepsilon$$

We say that f(x) has left-hand limit L at  $x_0$  and  $\lim_{x \to x_0^-} f(x) = L$ 

If for every number  $\varepsilon > 0$  there exists a corresponding number  $\delta > 0$  such that for all x

$$x_0 - \delta < x < x_0 \implies |f(x) - L| < \varepsilon$$

## Example

Prove that 
$$\lim_{x \to 0^+} \sqrt{x} = 0$$

#### Solution

Let  $\varepsilon > 0$  be given.  $x_0 = 0$ , L = 0, Find  $\delta > 0 \ni \forall x$ 

$$0 < x < \delta \implies \left| \sqrt{x} - 0 \right| < \varepsilon$$

or 
$$0 < x < \delta \implies \sqrt{x} < \varepsilon$$

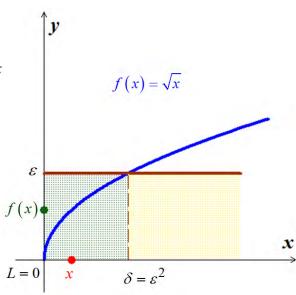

$$\left(\sqrt{x}\right)^2 < \varepsilon^2$$

$$\Rightarrow x < \varepsilon^2 \quad if \quad 0 < x < \delta$$

If we choose  $\delta = \varepsilon^2$ , we have

$$0 < x < \delta = \varepsilon^2 \implies \sqrt{x} < \varepsilon$$

According to the definition, this shows that  $\lim_{x\to 0^+} \sqrt{x} = 0$ 

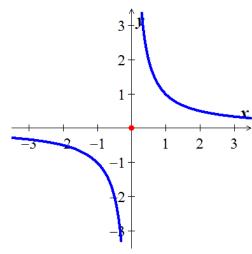

Discuss the behavior of the following function as  $x \to 0$ .

a) 
$$g(x) = \begin{cases} \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$$
 b)  $f(x) = \begin{cases} 0, & x \leq 0 \\ \sin \frac{1}{x}, & x > 0 \end{cases}$ 

$$b) \quad f(x) = \begin{cases} 0, & x \le 0\\ \sin\frac{1}{x}, & x > 0 \end{cases}$$

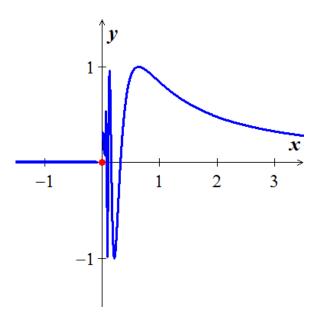

**Solution** 

a)

g(x) has no limit as  $x \to 0$  because the values of g(x) grow arbitrary large (negative and positive) value as  $x \rightarrow 0$  and do not stay close.

**b**)

f(x) has no limit as  $x \to 0$  because the function's values oscillate between -1 and +1 in every open interval containing 0. The values do not stay close to any one number as  $x \to 0$ .

### Limit Laws

If 
$$\lim_{x \to c} f(x) = L$$
 and  $\lim_{x \to c} g(x) = M$ 

Constant Multiple Rule: 
$$\lim_{x \to c} [bf(x)] = b \lim_{x \to c} f(x) = \underline{bL}$$

Sum and Difference Rules: 
$$\lim_{x \to c} [f(x) \pm g(x)] = \lim_{x \to c} f(x) \pm \lim_{x \to c} g(x) = \underline{L \pm M}$$

Product Rule: 
$$\lim_{x \to c} [f(x) \cdot g(x)] = \lim_{x \to c} f(x) \cdot \lim_{x \to c} g(x) = \underline{L.M}$$

Quotient Rule: 
$$\lim_{x \to c} \left( \frac{f(x)}{g(x)} \right) = \frac{\lim_{x \to c} f(x)}{\lim_{x \to c} g(x)} = \frac{L}{M} \qquad M \neq 0$$

Power Rule: 
$$\lim_{x \to c} (f(x))^n = \left[ \lim_{x \to c} f(x) \right]^n = \underline{L}^n$$

Root Rule: 
$$\lim_{x \to c} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x \to c} f(x)} = \sqrt[n]{L} \qquad n > 0, \quad L > 0, \quad n \text{ is even}$$

Find the following limits:

a) 
$$\lim_{x \to c} \left( x^3 + 4x^2 - 3 \right)$$
 b)  $\lim_{x \to c} \frac{x^4 + x^2 - 1}{x^2 + 5}$  c)  $\lim_{x \to -2} \sqrt{4x^2 - 3}$ 

b) 
$$\lim_{x \to c} \frac{x^4 + x^2 - 1}{x^2 + 5}$$

$$c) \quad \lim_{x \to -2} \sqrt{4x^2 - 3}$$

**Solution** 

a) 
$$\lim_{x \to c} (x^3 + 4x^2 - 3) = \lim_{x \to c} x^3 + \lim_{x \to c} 4x^2 - \lim_{x \to c} (3)$$
  
=  $\frac{c^3 + 4c^2 - 3}{2}$ 

Sum and Difference Rules

b) 
$$\lim_{x \to c} \frac{x^4 + x^2 - 1}{x^2 + 5} = \frac{\lim_{x \to c} \left(x^4 + x^2 - 1\right)}{\lim_{x \to c} \left(x^2 + 5\right)}$$
$$= \frac{\lim_{x \to c} x^4 + \lim_{x \to c} x^2 - \lim_{x \to c} 1}{\lim_{x \to c} x^2 + \lim_{x \to c} 5}$$
$$= \frac{c^4 + c^2 - 1}{c^2 + 5}$$

Quotient Rule

Sum and Difference Rules

c) 
$$\lim_{x \to -2} \sqrt{4x^2 - 3} = \sqrt{\lim_{x \to -2} (4x^2 - 3)}$$
  
 $= \sqrt{\lim_{x \to -2} 4x^2 - \lim_{x \to -2} 3}$   
 $= \sqrt{4(-2)^2 - 3}$   
 $= \sqrt{16 - 3}$   
 $= \sqrt{13}$ 

Root Rule

Difference Rule

# **Theorem** – Limits of Polynomials

If 
$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$$
, then  $\lim_{x \to c} P(x) = P(c) = a_n c^n + a_{n-1} c^{n-1} + \dots + a_1 c + a_0$ 

#### **Theorem** – Limits of Rational Functions

If 
$$P(x)$$
 and  $Q(x)$  are polynomials and  $Q(c) \neq 0$ , then 
$$\lim_{x \to c} \frac{P(x)}{Q(x)} = \frac{P(c)}{Q(c)}$$

#### Example

Find the limit: 
$$\lim_{x \to -1} \frac{x^3 + 4x^2 - 3}{x^2 + 5}$$

#### Solution

$$\lim_{x \to -1} \frac{x^3 + 4x^2 - 3}{x^2 + 5} = \frac{(-1)^3 + 4(-1)^2 - 3}{(-1)^2 + 5}$$
$$= \frac{0}{6}$$
$$= 0$$

# Eliminating Zero Denominators Algebraically

# Example

Evaluate: 
$$\lim_{x \to 1} \frac{x^2 + x - 2}{x^2 - x}$$

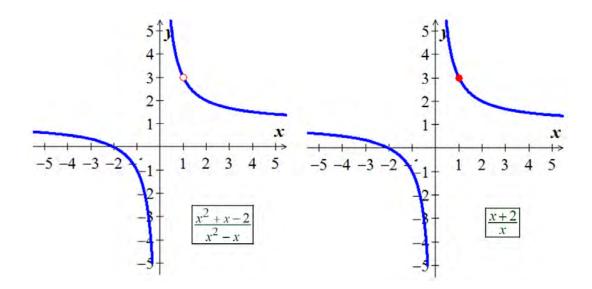

$$\lim_{x \to 1} \frac{x^2 + x - 2}{x^2 - x} = \frac{1^2 + 1 - 2}{1^2 - 1} = \frac{0}{0}$$

$$\lim_{x \to 1} \frac{x^2 + x - 2}{x^2 - x} = \lim_{x \to 1} \frac{(x - 1)(x + 2)}{x(x - 1)}$$

$$= \lim_{x \to 1} \frac{(x + 2)}{x}$$

$$= \frac{1 + 2}{1}$$

$$= 3$$

Evaluate: 
$$\lim_{x \to 0} \frac{\sqrt{x^2 + 100} - 10}{x^2}$$

$$\lim_{x \to 0} \frac{\sqrt{x^2 + 100 - 10}}{x^2} = \frac{\sqrt{0 + 100} - 10}{0} = \frac{0}{0}$$

$$\frac{\sqrt{x^2 + 100} - 10}{x^2} = \frac{\sqrt{x^2 + 100} - 10}{x^2} \cdot \frac{\sqrt{x^2 + 100} + 10}{\sqrt{x^2 + 100} + 10}$$

$$= \frac{x^2 + 100 - 100}{x^2 \left(\sqrt{x^2 + 100} + 10\right)}$$

$$= \frac{x^2}{x^2 \left(\sqrt{x^2 + 100} + 10\right)}$$

$$= \frac{1}{\sqrt{x^2 + 100} - 10}$$

$$\lim_{x \to 0} \frac{\sqrt{x^2 + 100} - 10}{x^2} = \lim_{x \to 0} \frac{1}{\sqrt{x^2 + 100} - 10}$$

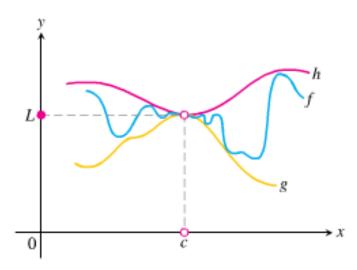

$$\lim_{x \to 0} \frac{\sqrt{x^2 + 100} - 10}{x^2} = \lim_{x \to 0} \frac{1}{\sqrt{x^2 + 100} + 10}$$

$$= \frac{1}{\sqrt{0 + 100} + 10}$$

$$= \frac{1}{10 + 10}$$

$$= \frac{1}{20}$$

# The Sandwich (Squeeze) Theorem

Suppose that  $g(x) \le f(x) \le h(x)$  for all x in some open interval containing c, except possibly at x = c itself. Suppose also that

$$\lim_{x \to c} g(x) = \lim_{x \to c} h(x) = L \quad then \quad \lim_{x \to c} f(x) = L$$

### **Example**

Given that  $1 - \frac{x^2}{4} \le u(x) \le 1 + \frac{x^2}{2}$  for all  $x \ne 0$ , find the  $\lim_{x \to 0} u(x)$ , no matter how complicated u is.

#### **Solution**

$$\lim_{x \to 0} \left( 1 - \frac{x^2}{4} \right) = 1 - \frac{0}{4}$$

$$= 1$$

$$\lim_{x \to 0} \left( 1 + \frac{x^2}{2} \right) = 1$$

The Sandwich theorem implies that  $\lim_{x\to 0} u(x) = 1$ 

# **Theorem**

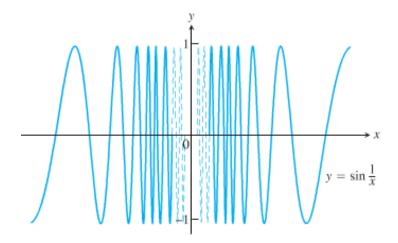

Suppose that  $f(x) \le g(x)$  for all x in some open interval containing c, except possibly at x = c itself, and the limits of f and g both exist as x approaches c, then

$$\lim_{x \to c} f(x) \le \lim_{x \to c} g(x)$$

#### **Example**

Show that  $y = \sin(\frac{1}{x})$  has no limit as x approaches zero from either side.

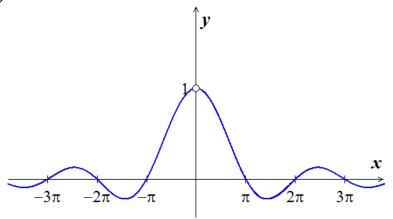

#### **Solution**

As x approaches zero, its reciprocal,  $\frac{1}{x}$ , grows without bound and the values of  $\sin\left(\frac{1}{x}\right)$  cycle repeatedly from -1 to 1.

There is no single number L that the function's values stay increasingly close to as x approaches zero. The function has neither a right-hand limit nor a left-hand limit at x = 0.

Limit Involving  $\frac{\sin \theta}{\theta}$ 

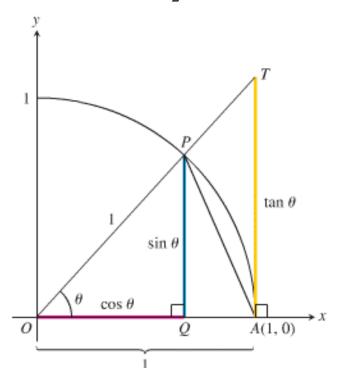

A central fact about  $\frac{\sin \theta}{\theta}$  is that in radian measure it limit as  $\theta \to 0$  is **1**.

**Theorem** 

$$\lim_{\theta \to 0} \frac{\sin \theta}{\theta} = 1 \quad (\theta \text{ in } rad.)$$

**Proof** 

We need to show that the right-hand limit is 1,  $\theta < \frac{\pi}{2}$ 

Notice that:

 $Area\ \Delta OAP\ < Area\ Sector\ OAP\ < Area\ \Delta OAT$ 

Area 
$$\triangle OAP = \frac{1}{2}base \times height = \frac{1}{2}(1)(\sin\theta)$$

Area Sector 
$$\triangle OAP = \frac{1}{2}r^2 \times \theta = \frac{1}{2}(1)^2(\theta) = \frac{\theta}{2}$$

Area 
$$\triangle OAP = \frac{1}{2}base \times height = \frac{1}{2}(1)(\tan\theta) = \frac{1}{2}\tan\theta$$

$$\Rightarrow \frac{1}{2}\sin\theta < \frac{1}{2}\theta < \frac{1}{2}\tan\theta$$

$$\frac{2}{\sin\theta} \frac{1}{2} \sin\theta < \frac{1}{2} \theta \frac{2}{\sin\theta} < \frac{1}{2} \frac{\sin\theta}{\cos\theta} \frac{2}{\sin\theta}$$

$$1 < \frac{\theta}{\sin \theta} < \frac{1}{\cos \theta}$$

 $1 < \frac{\theta}{\sin \theta} < \frac{1}{\cos \theta}$  Taking reciprocals reverses the inequalities

$$1 > \frac{\sin \theta}{\theta} > \cos \theta$$

Since 
$$\lim_{\theta \to 0^+} \cos \theta = 1$$
, then

$$\lim_{\theta \to 0^{-}} \frac{\sin \theta}{\theta} = 1 = \lim_{\theta \to 0^{+}} \frac{\sin \theta}{\theta}$$

So 
$$\lim_{\theta \to 0} \frac{\sin \theta}{\theta} = 1$$

## **Example**

Show that 
$$\lim_{x \to 0} \frac{\cos x - 1}{x} = 0$$

#### Solution

Using the half-angle formula:  $\cos x = 1 - 2\sin^2\left(\frac{x}{2}\right)$ 

$$\lim_{x \to 0} \frac{\cos x - 1}{x} = \lim_{x \to 0} \frac{1 - 2\sin^2\left(\frac{x}{2}\right) - 1}{x}$$

$$= \lim_{x \to 0} \frac{-2\sin^2\left(\frac{x}{2}\right)}{x}$$

$$= -\lim_{\theta \to 0} \frac{2\sin^2\left(\theta\right)}{2\theta}$$

$$= -\lim_{\theta \to 0} \frac{\sin \theta}{\theta} \sin \theta$$

$$= -(1)(0)$$

$$= 0$$

$$\lim_{x \to 0} \frac{\sin 2x}{5x} = \frac{2}{5}$$

#### Solution

$$\lim_{x \to 0} \frac{\sin 2x}{5x} = \lim_{x \to 0} \frac{\left(\frac{2}{5}\right)\sin 2x}{\left(\frac{2}{5}\right)5x}$$
$$= \frac{2}{5}\lim_{x \to 0} \frac{\sin 2x}{2x}$$
$$= \frac{2}{5}(1)$$
$$= \frac{2}{5} \Big|$$

Since we need 2x in the denominator

## Example

Show that 
$$\lim_{x \to 0} \frac{\tan x \sec 2x}{3x} = \frac{1}{3}$$

$$\lim_{x \to 0} \frac{\tan x \sec 2x}{3x} = \frac{1}{3} \lim_{x \to 0} \frac{1}{x} \cdot \frac{\sin x}{\cos x} \cdot \frac{1}{\cos 2x}$$

$$= \frac{1}{3} \lim_{x \to 0} \frac{\sin x}{x} \cdot \frac{1}{\cos x} \cdot \frac{1}{\cos 2x} \qquad \lim_{x \to 0} \frac{\sin x}{x} = 1, \quad \lim_{x \to 0} \frac{1}{\cos x} = 1, \quad \lim_{x \to 0} \frac{1}{\cos 2x} = 1$$

$$= \frac{1}{3} (1)(1)(1)$$

$$= \frac{1}{3}$$

# **Exercises** Section 1.2 – Definitions / Techniques of Limits

(1-121) Find the limit:

$$\begin{array}{ccc}
\mathbf{1.} & \lim_{x \to 3} (-1)
\end{array}$$

$$\begin{array}{ccc}
\mathbf{2.} & \lim_{x \to -1} & 3

**122.** For the function f(t) graphed, find the following limits or explain why they do not exist.

- $a) \lim_{t \to -2} f(t)$ 
  - $b) \lim_{t \to -1} f(t)$
- $c) \lim f(t)$  $t\rightarrow 0$
- $d) \lim_{t \to -0.5} f(t)$
- **123.** Suppose  $\lim_{x \to \infty} f(x) = 5$  and  $\lim_{x \to \infty} g(x) = -2$ . Find  $x \rightarrow c$  $x \rightarrow c$ 
  - $\lim_{x \to c} f(x)g(x)$

c)  $\lim_{x \to c} \left( f(x) + 3g(x) \right)$ 

 $\lim_{x \to c} 2f(x)g(x)$ 

d)  $\lim_{x \to c} \frac{f(x)}{f(x) - g(x)}$ 

- **124.** Explain why the limits do not exist for  $\lim_{x\to 0} \frac{x}{|x|}$
- (125 126) Evaluate the limit using the form  $\lim_{h\to 0} \frac{f(x+h)-f(x)}{h}$  for

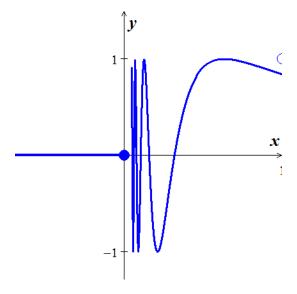

**125.** 
$$f(x) = x^2, x = 1$$

**126.** 
$$f(x) = \sqrt{3x+1}, \quad x = 0$$

**127.** If 
$$\lim_{x \to 4} \frac{f(x) - 5}{x - 2} = 1$$
, find  $\lim_{x \to 4} f(x)$ 

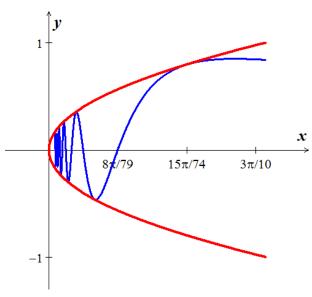

**128.** If 
$$\lim_{x \to 0} \frac{f(x)}{x^2} = 1$$
, find  $\lim_{x \to 0} f(x)$  and  $\lim_{x \to 0} \frac{f(x)}{x}$ 

- **129.** If  $x^4 \le f(x) \le x^2$   $-1 \le x \le 1$  and  $x^2 \le f(x) \le x^4$  x < -1 and x > 1. At what points c do you automatically know  $\lim_{x \to c} f(x)$ ? What can you say about the value of the limits at these points?
- **130.** Let  $f(x) = \begin{cases} 0, & x \le 0 \\ \sin \frac{1}{x}, & x > 0 \end{cases}$

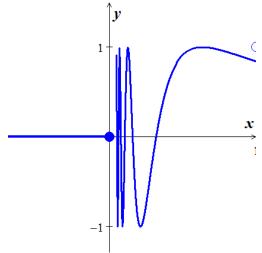

- a) Does  $\lim_{x\to 0^+} f(x)$  exist? If so, what is it? If not, why not?
- b) Does  $\lim_{x\to 0^{-}} f(x)$  exist? If so, what is it? If not, why not?
- c) Does  $\lim_{x\to 0} f(x)$  exist? If so, what is it? If not, why not?

**131.** Let  $g(x) = \sqrt{x} \sin \frac{1}{x}$ 

- a) Does  $\lim_{x\to 0^+} g(x)$  exist? If so, what is it? If not, why not?
- b) Does  $\lim_{x\to 0^{-}} g(x)$  exist? If so, what is it? If not, why not?
- c) Does  $\lim_{x\to 0} g(x)$  exist? If so, what is it? If not, why not?

**132.** Let  $f(x) = \begin{cases} 0, & x \le 0 \\ \sin \frac{1}{x}, & x > 0 \end{cases}$ 

- a) Does  $\lim_{x\to 0^+} f(x)$  exist? If so, what is it? If not, why not?
- b) Does  $\lim_{x\to 0^{-}} f(x)$  exist? If so, what is it? If not, why not?
- c) Does  $\lim_{x\to 0} f(x)$  exist? If so, what is it? If not, why not?

**133.** Which of the following statements about the function y = f(x) graphed here are true, and which are false?

a) 
$$\lim_{x \to -1^+} f(x) = 1$$

$$b) \quad \lim_{x \to 0^{-}} f(x) = 0$$

$$c) \quad \lim_{x \to 0^{-}} f(x) = 1$$

d) 
$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{+}} f(x)$$

e) 
$$\lim_{x\to 0} f(x)$$
 exists

$$f) \quad \lim_{x \to 0} f(x) = 0$$

$$g) \quad \lim_{x \to 0} f(x) = 1$$

$$h) \quad \lim_{x \to 1} f(x) = 1$$

$$i) \quad \lim_{x \to 1} f(x) = 0$$

$$j) \quad \lim_{x \to 2^{-}} f(x) = 2$$

k) 
$$\lim_{x \to -1^{-}} f(x) = 0$$
 does not exist

$$l) \quad \lim_{x \to 2^+} f(x) = 0$$

# **Section 1.3 – Infinite Limits**

# **Definitions**

We say that f(x) has the **limit** L **as** x **approaches infinity** and write  $\lim_{x\to\infty} f(x) = L$ 

If, 
$$\forall \varepsilon > 0 \exists N \ni \forall x$$
,  $x > M \implies |f(x) - L| < \varepsilon$ 

We say that f(x) has the **limit** L **as** x **approaches** minus **infinity** and write  $\lim_{x \to -\infty} f(x) = L$ 

If, 
$$\forall \varepsilon > 0 \exists N \ni \forall x$$
,  $x < M \implies |f(x) - L| < \varepsilon$ 

**Basic Facts:**  $\lim_{x \to \pm \infty} k = k$  and  $\lim_{x \to \pm \infty} \frac{1}{x} = 0$ 

## Example

Find  $\lim_{x \to \infty} \frac{5x^2 + 8x - 3}{3x^2 + 2}$ 

#### **Solution**

$$\lim_{x \to \infty} \frac{5x^2 + 8x - 3}{3x^2 + 2} = \lim_{x \to \infty} \frac{5 + \frac{8}{x} - \frac{3}{x^2}}{3 + \frac{2}{x^2}}$$

$$= \frac{5 + 0 - 0}{3 + 0}$$

$$= \frac{5}{3}$$
Divide by  $x^2$ 

$$\lim_{x \to \pm \infty} \frac{1}{x} = 0$$

$$= \frac{5}{3}$$

## Example

Find  $\lim_{x \to \infty} \frac{11x + 2}{2x^3 - 1}$ 

$$\lim_{x \to \infty} \frac{11x + 2}{2x^3 - 1} = \lim_{x \to \infty} \frac{\frac{11}{x^2} + \frac{2}{x^3}}{2 - \frac{1}{x^3}}$$

$$= \frac{0 + 0}{2 - 0}$$

$$= 0$$

# Vertical Asymptote (VA) - Think Domain

The line x = a is a *vertical asymptote* for the graph of a function f if

$$\lim_{x \to a^{+}} f(x) \to \pm \infty \quad or \quad \lim_{x \to a^{-}} f(x) \to \pm \infty$$

As x approaches a from either the left or the right

$$\lim_{x \to 0^{+}} \frac{1}{x} \to \infty \quad or \quad \lim_{x \to 0^{-}} \frac{1}{x} \to -\infty$$

#### **Example**

Find 
$$\lim_{x \to 3^+} \frac{2-5x}{x-3}$$
 and  $\lim_{x \to 3^-} \frac{2-5x}{x-3}$ 

#### Solution

$$\lim_{x \to 3^{+}} \frac{2-5x}{x-3} = \frac{2-5(3)}{3^{+}-3} \to \frac{-13}{3^{+}-3}$$

$$= -\infty$$

$$\lim_{x \to 3^{-}} \frac{2-5x}{x-3} = \frac{2-5(3)}{3^{-}-3} \to \text{negative and approaches } 0$$

$$= \infty$$

# Example

Find 
$$\lim_{x \to -4^+} \frac{-x^3 + 5x^2 - 6x}{-x^3 - 4x^2}$$

$$\lim_{x \to -4^{+}} \frac{-x^3 + 5x^2 - 6x}{-x^3 - 4x^2} = \frac{168}{0}$$

$$\frac{-x^3 + 5x^2 - 6x}{-x^3 - 4x^2} = \frac{(x - 2)(x - 3)}{x(x + 4)} \xrightarrow{\text{positive}}$$

$$\rightarrow \text{negative and approaches } 0$$

Let  $f(x) = \frac{x^2 - 4x + 3}{x^2 - 1}$ , determine the following limits and find the vertical asymptotes of f.

$$a) \quad \lim_{x \to 1} f(x)$$

$$b) \quad \lim_{x \to -1^{-}} f(x)$$

c) 
$$\lim_{x \to -1^+} f(x)$$

**Solution** 

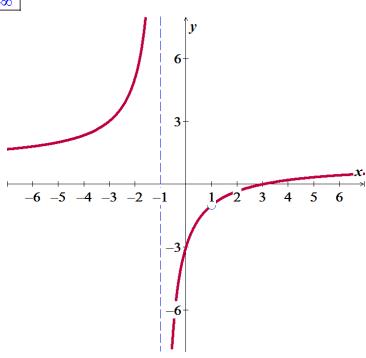

a) 
$$\lim_{x \to 1} \frac{x^2 - 4x + 3}{x^2 - 1} = \frac{0}{0} = \lim_{x \to 1} \frac{(x - 1)(x - 3)}{(x - 1)(x + 1)}$$
$$= \lim_{x \to 1} \frac{x - 3}{x + 1}$$
$$= -1$$

The vertical asymptote:  $\underline{x = -1}$ , while the hole is (1, -1)

**b**) 
$$\lim_{x \to -1^{-}} f(x) = \lim_{x \to -1^{-}} \frac{x-3}{x+1} \xrightarrow{\text{negative}} \text{negative and approaches } 0$$

$$= \infty$$

c) 
$$\lim_{x \to -1^{+}} f(x) = \lim_{x \to -1^{+}} \frac{x-3}{x+1} \to \text{negative}$$
  
 $\xrightarrow{x \to -1^{+}} 0$   $\xrightarrow{x \to -1^{+}} 0$   $\xrightarrow{x \to -1^{+}} 0$   $\xrightarrow{x \to -1^{+}} 0$   $\xrightarrow{x \to -1^{+}} 0$ 

Find 
$$\lim_{\theta \to 0^+} \cot \theta$$
 and  $\lim_{\theta \to 0^-} \cot \theta$ 

$$\cot \theta = \frac{\cos \theta}{\sin \theta}$$

$$\cot 0 = \frac{1}{0}$$

As 
$$\theta \to 0^+ \cos \theta > 0$$
;  $\sin \theta > 0$ 

$$\lim_{\theta \to 0^+} \cot \theta = \infty$$

As 
$$\theta \to 0^- \cos \theta > 0$$
;  $\sin \theta < 0$ 

$$\lim_{\theta \to 0^+} \cot \theta = -\infty$$

## Exercises

# **Section 1.3 – Infinite Limits**

(1-50) *Find* the limit

1. 
$$\lim_{x \to 5} \frac{x-7}{x(x-5)^2}$$

2. 
$$\lim_{x \to -5^+} \frac{x-5}{x+5}$$

3. 
$$\lim_{x \to 3^{-}} \frac{x-4}{x^2 - 3x}$$

4. 
$$\lim_{x \to 0^+} \frac{1}{3x}$$

5. 
$$\lim_{x \to -5^{-}} \frac{3x}{2x+10}$$

**6.** 
$$\lim_{x \to 0} \frac{1}{x^{2/3}}$$

7. 
$$\lim_{x \to 0^{-}} \frac{1}{3x^{1/3}}$$

8. 
$$\lim_{x \to \left(-\frac{\pi}{2}\right)^+} \sec x$$

9. 
$$\lim_{\theta \to 0^{-}} (1 + \csc \theta)$$

10. 
$$\lim_{\theta \to 0^+} \csc \theta$$

**11.** 
$$\lim_{x \to 0^+} (-10 \cot x)$$

12. 
$$\lim_{\theta \to \frac{\pi}{2}^+} \frac{1}{3} \tan \theta$$

13. 
$$\lim_{x \to 2^+} \frac{1}{x-2}$$

**14.** 
$$\lim_{x \to 2^{-}} \frac{1}{x-2}$$

15. 
$$\lim_{x \to 2} \frac{1}{x-2}$$

16. 
$$\lim_{x \to 3^+} \frac{2}{(x-3)^3}$$

17. 
$$\lim_{x \to 3^{-}} \frac{2}{(x-3)^3}$$

18. 
$$\lim_{x \to 3} \frac{2}{(x-3)^3}$$

19. 
$$\lim_{x \to 4^+} \frac{x-5}{(x-4)^2}$$

**20.** 
$$\lim_{x \to 4^{-}} \frac{x-5}{(x-4)^2}$$

**21.** 
$$\lim_{x \to 4} \frac{x-5}{(x-4)^2}$$

22. 
$$\lim_{x \to 1^+} \frac{x-2}{(x-1)^3}$$

23. 
$$\lim_{x \to 1^{-}} \frac{x-2}{(x-1)^3}$$

**24.**

- b) For what values of a, if any, does  $\lim_{x \to a^{+}} f(x) = \infty$ ?
- c) For what values of a, if any, does  $\lim_{x \to a^{+}} f(x) = -\infty$ ?
- 52. Analyze  $\lim_{x \to 1^+} \sqrt{\frac{x-1}{x-3}}$  and  $\lim_{x \to 1^-} \sqrt{\frac{x-1}{x-3}}$

# Section 1.4 – Limits at Infinity

Notation	Terminology		
$f(x) \to \infty$	f(x) increases without bound (can be made as large positive as desired)		
$f(x) \to -\infty$	f(x) decreases without bound (can be made as large negative as desired)		

# Horizontal Asymptote (HA)

The line y = b is a **horizontal asymptote** for the graph of a function f if

$$\lim_{x \to \infty} f(x) = b \quad \text{or} \quad \lim_{x \to -\infty} f(x) = b$$

Let 
$$f(x) = \frac{p(x)}{q(x)}$$
  

$$= \frac{a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0}{b_m x^m + b_{m-1} x^{m-1} + \dots + b_1 x + b_0}$$

$$= \frac{a_n x^n}{b_m x^m}$$

1. If the degree of numerator is less than of denominator  $(n < m) \Rightarrow y = 0$ 

$$y = \frac{2x+1}{4x^2+5}$$

$$HA: \quad y=0$$

**2.** If the degree of numerator is equal of denominator  $(n = m) \Rightarrow y = \frac{a_n}{b_m}$ 

$$y = \frac{2x^2 + 1}{4x^2 + 5}$$

**HA**: 
$$y = \frac{2}{4} = \frac{1}{2}$$

**3.** If the degree of numerator is greater than of denominator  $(n > m) \Rightarrow$  No horizontal asymptote

$$y = \frac{2x^3 + 1}{4x^2 + 5}$$

$$\Rightarrow No HA$$

Find the horizontal asymptotes of the graph of  $f(x) = \frac{x^3 - 2}{|x|^3 + 1}$ 

## **Solution**

For  $x \ge 0$ 

$$\lim_{x \to \infty} \frac{x^3 - 2}{|x|^3 + 1} = \lim_{x \to \infty} \frac{x^3}{x^3}$$

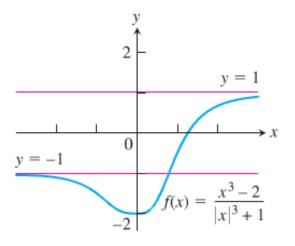

$$= 1$$

For  $x \le 0$ 

$$\lim_{x \to \infty} \frac{x^3 - 2}{|x|^3 + 1} = \lim_{x \to -\infty} \frac{x^3}{(-x)^3}$$

$$= -1$$

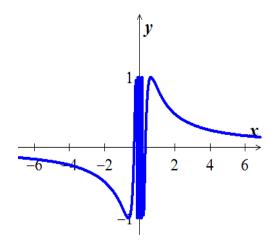

The *HA* are  $y = \pm 1$ 

# Example

Find 
$$\lim_{x \to \infty} \sin\left(\frac{1}{x}\right)$$

Let 
$$t = \frac{1}{x}$$
  
 $\Rightarrow t \to 0 \text{ as } x \to \infty$   
 $\lim_{x \to \infty} \sin\left(\frac{1}{x}\right) = \lim_{t \to 0} \sin t$   
 $= 0$ 

Find 
$$\lim_{x \to \pm \infty} x \sin\left(\frac{1}{x}\right)$$

#### **Solution**

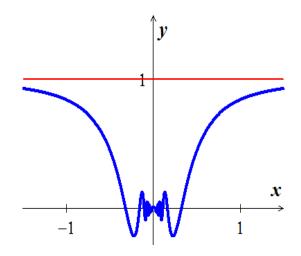

Let 
$$t = \frac{1}{x} \Rightarrow x = \frac{1}{t}$$
  

$$\lim_{x \to \infty} x \sin\left(\frac{1}{x}\right) = \lim_{t \to 0^{+}} \frac{\sin t}{t}$$

$$= 1$$

$$\lim_{x \to -\infty} x \sin\left(\frac{1}{x}\right) = \lim_{t \to 0^{-}} \frac{\sin t}{t}$$

$$= 1$$

# Example

Find the horizontal asymptote of  $y = 2 + \frac{\sin x}{x}$ 

#### **Solution**

Since 
$$0 \le \left| \frac{\sin x}{x} \right| \le \left| \frac{1}{x} \right|$$

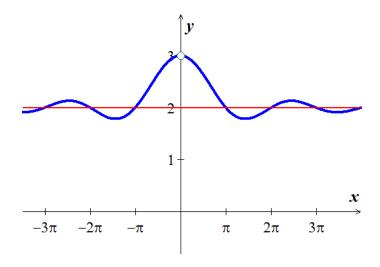

$$\lim_{x \to \pm \infty} \left| \frac{1}{x} \right| = 0$$

$$\lim_{x \to \pm \infty} \frac{\sin x}{x} = 0$$

$$\lim_{x \to \pm \infty} \left( 2 + \frac{\sin x}{x} \right) = 2 + 0$$

<u>= 2</u>

The **HA** is y = 2

Find 
$$\lim_{x \to \infty} \left( x - \sqrt{x^2 + 16} \right)$$

### **Solution**

$$\lim_{x \to \infty} \left( x - \sqrt{x^2 + 16} \right) = \lim_{x \to \infty} \left( x - \sqrt{x^2 + 16} \right) \frac{x + \sqrt{x^2 + 16}}{x + \sqrt{x^2 + 16}}$$

$$= \lim_{x \to \infty} \frac{x^2 - \left( x^2 + 16 \right)}{x + \sqrt{x^2 + 16}}$$

$$= \lim_{x \to \infty} \frac{x^2 - x^2 - 16}{x + \sqrt{x^2 + 16}}$$

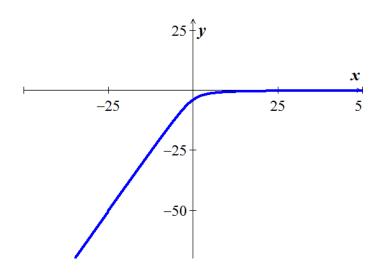

$$= \lim_{x \to \infty} \frac{-16}{x + \sqrt{x^2 + 16}}$$

$$= \lim_{x \to \infty} \frac{-\frac{16}{x}}{\frac{x}{x} + \sqrt{\frac{x^2 + 16}{x^2}}}$$

$$= \lim_{x \to \infty} \frac{-\frac{16}{x}}{1 + \sqrt{1 + \frac{16}{x^2}}}$$

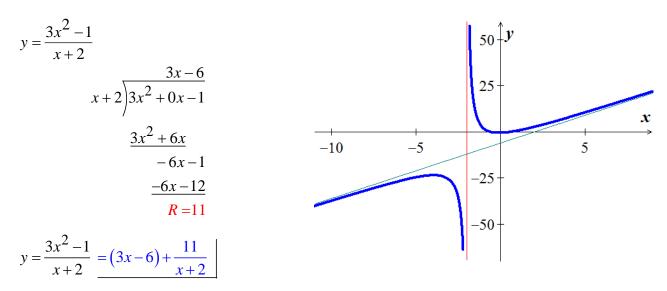

$$= \frac{0}{1 + \sqrt{1 + 0}}$$

=0

### **Slant or Oblique Asymptotes**

When the degree of the numerator is one greater than the degree of the numerator, the graph has a *slant* or *oblique* asymptote and it is a line y = ax + b,  $a \ne 0$ . To find the slant asymptote, divide the fraction using long division. The quotient (not remainder) is the slant asymptote.

The *oblique asymptote* is the line y = 3x - 6

# **Example**

Find the horizontal and vertical asymptotes of the curve  $y = \frac{x+3}{x+2}$ 

# **Solution**

$$HA: y \to \frac{x}{x} = 1 \implies y = 1$$

$$VA: x+2=0 \Rightarrow x=-2$$

# **Example**

Find the horizontal and vertical asymptotes of the curve  $f(x) = -\frac{8}{x^2 - 4}$ 

### **Solution**

$$y \to \lim_{x \to \infty} -\frac{8}{x^2} = 0$$

$$HA: y=0$$

$$VA: x^2 - 4 = 0 \implies \underline{x = \pm 2}$$

$$\lim_{x \to 2^{+}} f(x) = -\infty \quad and \quad \lim_{x \to 2^{-}} f(x) = \infty$$

## **Infinite Limits**

The limit has a value of infinity or minus infinity, such a function  $f(x) = \frac{1}{x}$ . It is convenient to describe the behavior of f by saying that f(x) approaches  $\infty$  as  $x \to 0^+$ .

# Definition

$$\lim_{x \to 0^+} f(x) = \infty$$

That  $\lim_{x\to 0^+} \frac{1}{x}$  doesn't exist because  $\frac{1}{x}$  becomes arbitrary large and positive as  $x\to 0^+$ .

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{-}} \frac{1}{x} = -\infty$$

That  $\lim_{x\to 0^{-}} \frac{1}{x}$  doesn't exist because  $\frac{1}{x}$  becomes arbitrary large and negative as  $x\to 0^{-}$ .

# **Example**

Find

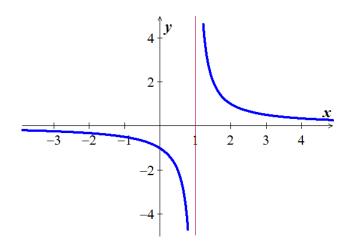

$$\lim_{x \to 1^+} \frac{1}{x-1} \quad and \quad \lim_{x \to 1^-} \frac{1}{x-1}$$

### **Solution**

As 
$$x \to 1^+ \implies x - 1 \to 0^+$$

$$\lim_{x \to 1^+} \frac{1}{x - 1} = \infty$$

$$\lim_{x \to 1^{-}} \frac{1}{x - 1} = -\infty$$

$$\lim_{x \to 2} \frac{(x-2)^2}{x^2 - 4} = \lim_{x \to 2} \frac{(x-2)^2}{(x-2)(x+2)}$$

$$= \lim_{x \to 2} \frac{(x-2)^2}{(x-2)(x+2)}$$

$$= \lim_{x \to 2} \frac{(x-2)^2}{(x-2)(x+2)}$$

$$= \frac{0}{4}$$

$$= 0$$

$$\lim_{x \to 2} \frac{x-2}{x^2 - 4} = \lim_{x \to 2} \frac{x-2}{(x-2)(x+2)}$$

$$= \lim_{x \to 2} \frac{1}{x+2}$$

$$= \frac{1}{4}$$

$$\lim_{x \to 2^{+}} \frac{x-3}{x^{2}-4} = \lim_{x \to 2^{+}} \frac{x-3}{(x-2)(x+2)}$$

$$= -\infty$$

$$\lim_{x \to 2^{-}} \frac{x-3}{x^2 - 4} = \lim_{x \to 2^{-}} \frac{x-3}{(x-2)(x+2)}$$

$$= \infty$$

$$\lim_{x \to 2} \frac{x-3}{x^2 - 4} = \lim_{x \to 2} \frac{x-3}{(x-2)(x+2)}$$
$$= \frac{\operatorname{doesn't exist}}{}$$

#### Exercises Section 1.4 – Limits at Infinity

Find the limit as  $x \to \infty$  and as  $x \to -\infty$  of

1. 
$$h(x) = \frac{-5 + \frac{7}{x}}{3 - \frac{1}{x^2}}$$

**4.** 
$$f(x) = \frac{x+1}{x^2+3}$$

**4.** 
$$f(x) = \frac{x+1}{x^2+3}$$
 **6.**  $f(x) = \frac{9x^4+x}{2x^4+5x^2-x+6}$ 

2. 
$$f(x) = \frac{2x+3}{5x+7}$$

$$f(x) = \frac{7x^3}{x^3 - 3x^2 + 6x}$$

5. 
$$f(x) = \frac{7x^3}{x^3 - 3x^2 + 6x}$$
 7.  $f(x) = \frac{-2x^3 - 2x + 3}{3x^3 + 3x^2 - 5x}$ 

3.  $f(x) = \frac{2x^3 + 7}{x^3 + x^2 + x + 7}$ 

(8-60) Evaluate the limits

$$\mathbf{8.} \quad \lim_{x \to \infty} x^{12}$$

$$9. \quad \lim_{x \to -\infty} 3x^9$$

$$10. \quad \lim_{x \to -\infty} x^{-8}$$

$$11. \quad \lim_{x \to -\infty} x^{-9}$$

12. 
$$\lim_{x \to -\infty} 2x^{-6}$$

**13.** 
$$\lim_{x \to \infty} \left( 3x^{12} - 9x^7 \right)$$

$$14. \quad \lim_{x \to -\infty} \left( 3x^7 + x^2 \right)$$

**15.** 
$$\lim_{x \to -\infty} \left( -2x^{16} + 2 \right)$$

**16.** 
$$\lim_{x \to -\infty} \left( 2x^{-6} + 4x^5 \right)$$

17. 
$$\lim_{x \to -\infty} \frac{\cos x}{3x}$$

$$18. \quad \lim_{x \to \infty} \frac{x + \sin x}{2x + 7 - 5\sin x}$$

19. 
$$\lim_{x \to \infty} \sqrt{\frac{8x^2 - 3}{2x^2 + x}}$$

**20.**

# **Section 1.5 – Continuity**

## **Definition of Continuity**

Let c be a number in the interval (a, b), and let f be a function whose domain contains the interval (a, b). The function f is continuous at the point c if the following conditions are true.

- 1. f(c) is defined
- 2.  $\lim_{x \to c} f(x)$  exists
- $3. \quad \lim_{x \to c} f(x) = f(c)$

If f is continuous at every point in the interval (a, b), then it is continuous on an open interval (a, b)

# Definition

**Interior point**: A function y = f(x) is **continuous at an interior point** c of its domain if

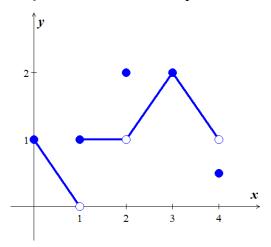

$$\lim_{x \to c} f(x) = f(c)$$

**Endpoint**: A function y = f(x) is **continuous at a left point** a or is **continuous at a right point** b of its domain if

$$\lim_{x \to a^{+}} f(x) = f(a) \quad or \quad \lim_{x \to b^{-}} f(x) = f(b), \quad respectively$$

If a function f is not continuous at a point c, we say that f is **discontinuous** at c. (is a **point of discontinuity**)

Find the points at which the function f is continuous and the points at which f is not continuous

### **Solution**

The function f is continuous at every point in its domain [0, 4] except at x = 1, x = 2, and x = 4. At these points, there are breaks in the graph.

$$x = 0$$
  $\lim_{x \to 0^{+}} f(x) = f(0) = 1$   $f$  is continuous @  $x = 0$ 

$$x = 1$$
  $\lim_{x \to 1} f(x) \frac{doesn't \ exist}{doesn't \ exist}$   $f$  is discontinuous @  $x = 1$ 

$$x = 2$$
  $\lim_{x \to 2} f(x) = 1$ , but  $1 \neq f(2)$  f is discontinuous @  $x = 2$ 

$$x = 3$$
  $\lim_{x \to 3} f(x) = f(3) = 2$   $f$  is continuous @  $x = 3$ 

$$x = 4$$
  $\lim_{x \to 4^{-}} f(x) = 1$ , but  $1 \neq f(4)$   $f$  is discontinuous @  $x = 4$ 

$$c < 0, c > 4$$
 These points are not in the domain of  $f$ .  $f$  is discontinuous

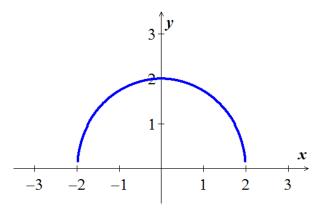

$$0 < c < 4$$
,  $c \ne 1,2$   $\lim_{x \to c} f(x) = f(c)$ 

At what points the function  $f(x) = \sqrt{4 - x^2}$  is continuous?

### **Solution**

The function is continuous at every point of its domain [-2, 2].

Including x = -2, where f is right-continuous, and x = 2, where f is left-continuous.

### Continuous Functions

A function is *continuous on an interval* iff it is continuous at every point of the interval. A *continuous function* is one that is continuous at every point of its domain. A continuous function need not be continuous on every interval.

## Example

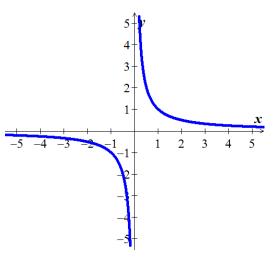

Determine at which points do the function  $f(x) = \frac{1}{x}$  is continuous and discontinuous

**Solution** 

The function f(x) is a continuous function because it is continuous at every point of its domain.

It has a point of discontinuity at x = 0, however, because it is not defined.

It is discontinuous on any interval containing x = 0

## **Theorem** – Properties of Continuous Functions

If the functions f and g are continuous at x = c, then the following combinations are continuous at x = c.

Sums and Differences  $f \pm g$ 

Constant multiples  $k \cdot g$ , for any number k.

Products  $f \cdot g$ 

Quotients  $\frac{f}{g}$ 

Powers  $f^n$  **n** a positive integer

*Roots*  $\sqrt[n]{f}$ , provided it is defined on an open interval containing c, where n is a positive integer

### **Proof**

$$\lim_{x \to c} (f+g)(x) = \lim_{x \to c} (f(x) + g(x))$$

$$= \lim_{x \to c} f(x) + \lim_{x \to c} g(x)$$

$$= f(c) + g(c)$$

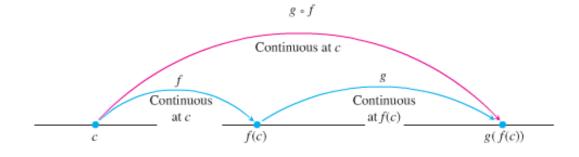

$$= (f+g)(c)$$

This shows that f + g is continuous

# **Composites**

All composites of continuous functions are continuous.

If f(x) is continuous at x = c and g(x) is continuous at x = f(c), then  $g \circ f$  is continuous at x = c

Show that  $y = \sqrt{x^2 - 2x - 5}$  is continuous everywhere on its domain

### **Solution**

Let 
$$\begin{cases} f(x) = x^2 - 2x - 5, & Domain: \mathbb{R} \\ g(x) = \sqrt{x} & Domain: [0, \infty) \end{cases}$$

 $\therefore$  The function y is continuous on  $[0, \infty)$ 

### **Example**

Show that  $y = \left| \frac{x \sin x}{x^2 + 2} \right|$  is continuous everywhere on its domain

### Solution

Let 
$$\begin{cases} x \sin x & Domain : \mathbb{R} \\ x^2 + 2 & Domain : \mathbb{R} \end{cases}$$

... The function is the composite of a quotient continuous functions with the continuous absolute value function.

## **Theorem**

If g is continuous at the point b and  $\lim_{x\to c} f(x) = b$ , then

$$\lim_{x \to c} g(f(x)) = g(b) = g\left(\lim_{x \to c} f(x)\right)$$

# **Proof**

Let  $\varepsilon > 0$  be given. Since g is continuous at b, there exists a number  $\delta_1 > 0$  such that

$$|g(y)-g(b)| < \varepsilon$$
 whenever  $0 < |y-b| < \delta_1$ 

$$\lim_{x \to c} f(x) = b, \ \exists \ \delta > 0 \ \exists \ \left| f(x) - b \right| < \delta_1 \quad whenever \quad 0 < \left| x - c \right| < \delta$$

If we let y = f(x), we then have that  $|y - b| < \delta_1$  whenever  $0 < |x - c| < \delta$ 

Which implies from the first statement that  $|g(y) - g(b)| = |g(f(x)) - g(b)| < \varepsilon$  whenever  $0 < |x - c| < \delta$ . From the definition of the limit, this proves that  $\lim_{x \to c} g(f(x)) = g(b)$ 

Find the 
$$\lim_{x \to \frac{\pi}{2}} \cos\left(2x + \sin\left(\frac{3\pi}{2} + x\right)\right)$$

### **Solution**

$$\lim_{x \to \frac{\pi}{2}} \cos\left(2x + \sin\left(\frac{3\pi}{2} + x\right)\right) = \cos\left(\lim_{x \to \frac{\pi}{2}} 2x + \lim_{x \to \frac{\pi}{2}} \sin\left(\frac{3\pi}{2} + x\right)\right)$$

$$= \cos\left(\pi + \sin 2\pi\right)$$

$$= \cos\left(\pi + 0\right)$$

$$= \cos\left(\pi\right)$$

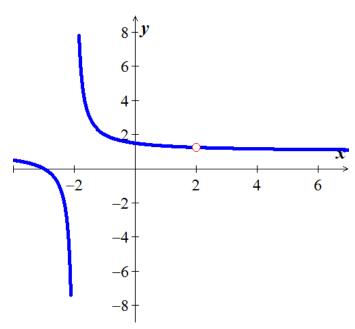

$$= -1$$

## **Example**

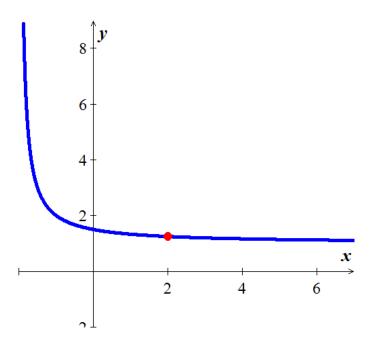

Show that  $f(x) = \frac{x^2 + x - 6}{x^2 - 4}$ ,  $x \ne 2$  has a continuous extension to x = 2, and find that extension.

#### **Solution**

$$f(x) = \frac{x^2 + x - 6}{x^2 - 4}$$
$$= \frac{(x - 2)(x + 3)}{(x - 2)(x + 2)}$$
$$= \frac{x + 3}{x + 2}$$

After simplification the function is continuous at x = 2

After simplification the function is continuous at x = 2

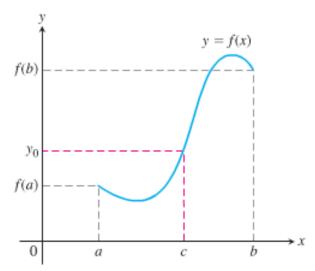

$$\lim_{x \to 2} \frac{x^2 + x - 6}{x^2 - 4} = \lim_{x \to 2} \frac{x + 3}{x + 2}$$

$$= \frac{5}{4}$$

The new function is the function f with its point of discontinuity at x = 2 removed.

# **Theorem** – the Intermediate Value Theorem for Continuous Functions

If f is a continuous function on a closed interval [a, b], and if  $y_0$  is any value between f(a) and f(b), then  $y_0 = f(c)$  for some c in [a, b].

## A Consequence for Root Finding

We call a solution of the equation f(x) = 0 a **root** of the equation or zero of the function f. The Intermediate Value Theorem said that if f is continuous, then any interval on which f changes sign contains a zero of the function.

# **Example**

Show that there is a root of the equation  $x^3 - x - 1$  between 1 and 2.

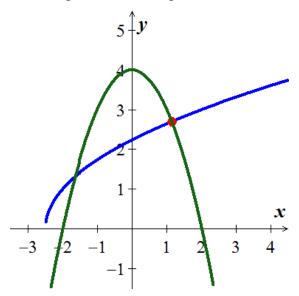

## **Solution**

$$f(1) = 1^3 - 1 - 1 = -1 < 0$$

$$f(2) = 2^3 - 2 - 1 = 5 > 0$$

Since f is continuous, the Intermediate Value Theorem says there is a zero of f between 1 and 2.

Use the Intermediate Value Theorem to prove that the equation  $\sqrt{2x+5} = 4 - x^2$  has a solution.

#### **Solution**

The function  $g(x) = \sqrt{2x+5}$  is continuous on the interval  $\left[-\frac{5}{2}, \infty\right)$  since it is the composite of the square root function with nonnegative linear function y = 2x+5.

Then the function  $f(x) = \sqrt{2x+5} + x^2$  is the sum of the function g(x) and  $y = x^2$ .

It follows that f(x) is continuous on the interval  $\left[-\frac{5}{2}, \infty\right)$ .

By trial and error:

$$f(0) = \sqrt{2(0) + 5} + 0^2 = \sqrt{5} > 0$$

$$f(2) = \sqrt{2(2) + 5} + 2^2 = \sqrt{9} + 4 = 7 > 0$$

f is continuous on the interval  $[0, 2] \subset \left[-\frac{5}{2}, \infty\right)$ .

Since the value  $y_0 = 4$  is between  $\sqrt{5}$  and 7, by the Intermediate Value Theorem there is a number  $c \in [0, 2]$   $\ni f(c) = 4$ . That is, the number c solves the original equation.

Given the graphed function f(x)1.

a) Does 
$$f(-1)$$
 exist?

b) Does 
$$\lim_{x \to -1^+} f(x)$$
 exist?

c) Does 
$$\lim_{x \to -1^+} f(x) = f(-1)$$
?

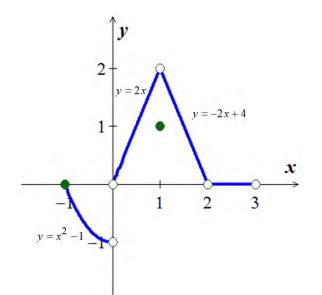

d) Is 
$$f$$
 continuous at  $x = -1$ ?

e) Does 
$$f(1)$$
 exist?

f) Does 
$$\lim_{x \to 1} f(x)$$
 exist?

g) Does 
$$\lim_{x \to 1} f(x) = f(1)$$
?

At what point(s) is the given function continuous?

2. 
$$y = \frac{1}{x-2} - 3x$$

$$6. y = \tan \frac{\pi x}{2}$$

**9.** 
$$y = \sqrt{2x+3}$$

3. 
$$y = \frac{x+3}{x^2 - 3x - 10}$$
 7.  $y = \frac{x \tan x}{x^2 + 1}$ 

$$y = \frac{x \tan x}{x^2 + 1}$$

**10.** 
$$y = \sqrt[4]{3x - 1}$$

4. 
$$y = |x-1| + \sin x$$

8. 
$$y = \frac{\sqrt{x^4 + 1}}{2}$$

10. 
$$y = \sqrt[4]{3x-1}$$
  
11.  $y = (2-x)^{1/5}$ 

$$5. y = \frac{x+2}{\cos x}$$

12. Find 
$$\lim_{x\to\pi} \sin(x-\sin x)$$
, then is the function continuous at the point being approached?

13. Find 
$$\lim_{x\to 0} \tan\left(\frac{\pi}{4}\cos\left(\sin x^{1/3}\right)\right)$$
, then is the function continuous at the point being approached?

**14.** Find 
$$\lim_{t\to 0} \cos\left(\frac{\pi}{\sqrt{19-3\sec 2t}}\right)$$
, then is the function continuous at the point being approached?

**15.** Explain why the equation 
$$\cos x = x$$
 has at least one solution.

(16-19) Show that the equation has three solutions in the given interval

**16.** 
$$x^3 - 15x + 1 = 0$$
;  $[-4, 4]$ 

**18.** 
$$70x^3 - 87x^2 + 32x - 3 = 0$$
; (0, 1)

**17.** 
$$x^3 + 10x^2 - 100x + 50 = 0$$
; (-20, 10) **19.**  $x^3 - 3x - 1 = 0$ ; [-2, 2]

**19.** 
$$x^3 - 3x - 1 = 0$$
;  $[-2, 2]$ 

- Show that the equation has six solutions in the given interval  $x^6 8x^4 + 10x^2 1 = 0$ ; [-3, 3] 20.
- If functions f(x) and g(x) are continuous for  $0 \le x \le 1$ , could  $\frac{f(x)}{g(x)}$  possibly be discontinuous at 21. a point of [0, 1]? Give reason for your answer.
- Suppose that a function f is continuous on the closed interval [0, 1] and that  $0 \le f(x) \le 1$  for every x in [0, 1]. Show that there must exist a number c in [0, 1] such that f(c) = c (c is called a *fixed* **point** of f).
- Use the Intermediate Value Theorem to show that the equation  $x^5 + 7x + 5 = 0$  has a solution in the interval (-1, 0).
- The amount of an antibiotic (in mg) in the blood t hours after an intravenous line is opened is given 24. by

$$m(t) = 100(e^{-0.1t} - e^{-0.3t})$$

- a) Use the Intermediate Value Theorem to show that the amount of drug is 30 mg at some time in the interval [0, 5] and again at some time in the interval [5, 15]
- b) Estimate the times at which m = 30 mg
- c) Is the amount of drug in the blood ever 50 mg?
- (25-27) Determine whether the following functions are continuous at a.

**25.** 
$$f(x) = \frac{1}{x-5}$$
;  $a = 5$ 

**26.** 
$$h(x) = \sqrt{x^2 - 9}$$
;  $a = 3$ 

27. 
$$g(x) = \begin{cases} \frac{x^2 - 16}{x - 4} & \text{if } x \neq 4 \\ 8 & \text{if } x = 4 \end{cases}$$
;  $a = 4$ 

Find the intervals on which the following functions are continuous. Specify right- or left-(28 - 31)continuity at the endpoints

**28.** 
$$f(x) = \sqrt{x^2 - 5}$$

**29.** 
$$f(x) = e^{\sqrt{x-2}}$$

**28.** 
$$f(x) = \sqrt{x^2 - 5}$$
 **29.**  $f(x) = e^{\sqrt{x-2}}$  **30.**  $f(x) = \frac{2x}{x^3 - 25x}$  **31.**  $f(x) = \cos e^x$ 

$$31. \quad f(x) = \cos e^x$$

32. Let 
$$g(x) = \begin{cases} 5x-2 & \text{if } x < 1 \\ a & \text{if } x = 1 \\ ax^2 + bx & \text{if } x > 1 \end{cases}$$

Determine values of the constants a and b for which g(x) is continuous at x = 1

55

# Section 1.6 - Precise Definition of a Limit

## Example

Consider the function y = 2x - 1 near  $x_0 = 4$ . Intuitively it appears that y is close to 7 when x is close to 4, so  $\lim_{x \to 4} (2x - 1) = 7$ . However, how close to  $x_0 = 4$  does x have to be so that y = 2x - 1 differs from 7 by, say less than 2 units?

#### Solution

We need to find the values of x for |y-7| < 2.

$$|y-7| = |2x-1-7| = |2x-8|$$

$$|2x-8| < 2$$

$$-2 < 2x-8 < 2$$

$$-2+8 < 2x-8+8 < 2+8$$

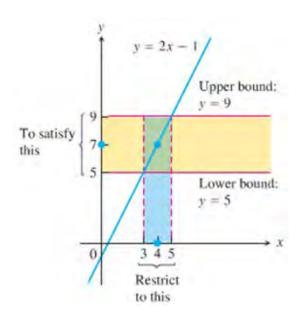

$$6 < 2x < 10$$

$$\frac{6}{2} < \frac{2x}{2} < \frac{10}{2}$$

$$3 < x < 5$$

$$3-4 < x-4 < 5-4$$

$$-1 < x-4 < 1$$

Keeping x within 1 unit of  $x_0 = 4$  will keep y within 2 units of  $y_0 = 7$ 

# **Definition**

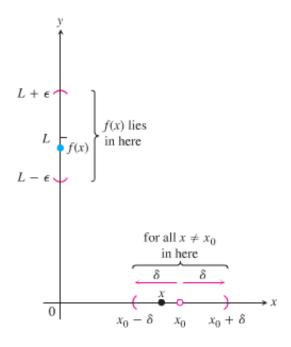

Let f(x) be defined on an open interval about  $x_0$ , except possibly at  $x_0$  itself.

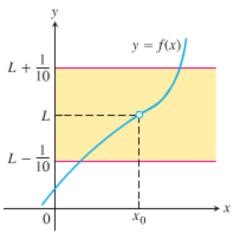

We say that the limit of f(x) as x approaches  $x_0$  is the number L, and write

$$\lim_{x \to x_0} f(x) = L$$

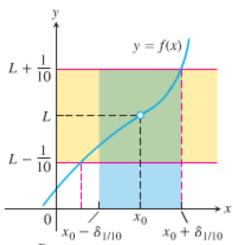

If, for every number  $\varepsilon > 0$ , there exists a corresponding number  $\delta > 0$  such that for all x,

$$0 < |x - x_0| < \delta \implies |f(x) - L| < \varepsilon$$

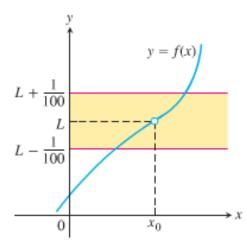

The challenge: Make 
$$|f(x) - L| < \epsilon = \frac{1}{10}$$

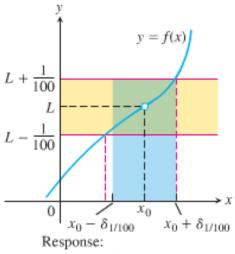

Response:

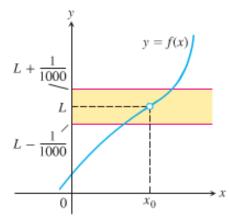

$$\left|x - x_0\right| < \delta_{1/10}$$
 (a number)

New challenge:  
Make 
$$|f(x) - L| < \epsilon = \frac{1}{100}$$

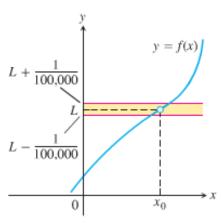

$$|x - x_0| < \delta_{1/100}$$

 $L + \frac{1}{1000}$   $L - \frac{1}{1000}$   $x_0$ 

New challenge:  $\epsilon = \frac{1}{1000}$ 

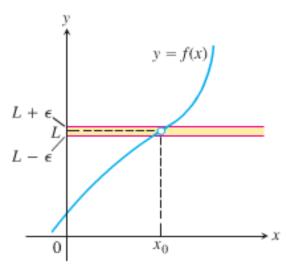

Response: 
$$|x - x_0| < \delta_{1/1000}$$

New challenge:  $\epsilon = \frac{1}{100,000}$ 

New challenge:

$$\epsilon = \cdots$$

Show that  $\lim_{x \to 1} (5x - 3) = 2$ 

### Solution

Let  $x_0 = 1$ , f(x) = 5x - 3, and L = 2.

For any given  $\varepsilon > 0$ , there exists a  $\delta > 0$  so that  $x \neq 1$  and x is within distance  $\delta$  of  $x_0 = 1$ , that is

59

$$0 < |x-1| < \delta \implies |f(x)-2| < \varepsilon$$

$$|(5x-3)-2| < \varepsilon$$

$$|5x-5| < \varepsilon$$

$$5|x-1| < \varepsilon$$

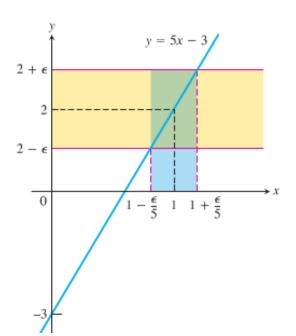

$$|x-1| < \frac{\varepsilon}{5}$$

Thus, we can take:  $\delta = \frac{\mathcal{E}}{5}$ 

If 
$$0 < |x-1| < \delta = \frac{\varepsilon}{5}$$

$$\left| \left( 5x - 3 \right) - 2 \right| = \left| 5x - 5 \right| = 5 \left| x - 1 \right| = 5 \frac{\mathcal{E}}{5} = \varepsilon$$

Which proves that  $\lim_{x \to 1} (5x - 3) = 2$ 

# Example

Prove the results presented graphically  $\lim_{x \to x_0} x = x_0$ 

## Solution

Let  $\varepsilon > 0$  be given, we must find  $\delta > 0$  such that for all x

$$0 < |x - x_0| < \delta \implies |x - x_0| < \varepsilon$$

This implication will hold if  $\delta = \varepsilon$  or any smaller number.

For the limit  $\lim_{x\to 5} \sqrt{x-1} = 2$ , find a  $\delta > 0$  that works for  $\varepsilon = 1$ . That is, find a  $\delta > 0$  such that for all x:

$$0 < |x-5| < \delta \implies \left| \sqrt{x-1} - 2 \right| < 1$$

Solution

$$\left|\sqrt{x-1}-2\right| < 1$$

$$-1 < \sqrt{x-1}-2 < 1$$

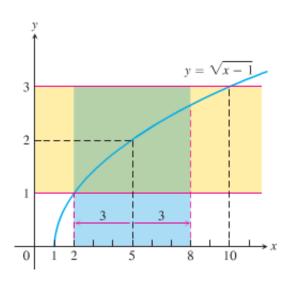

$$-1+2 < \sqrt{x-1}-2+2 < 1+2$$

$$1 < \sqrt{x-1} < 3$$

$$1 < x-1 < 9$$

$$1+1 < x-1+1 < 9+1$$

$$2 < x < 10$$

The inequality holds for all x in the open interval (2, 10).

So it holds for all  $x \neq 5$  in the interval as well.

Finding  $\delta$  value.

$$5 - \delta < x < 5 + \delta$$
 Centered at  $x_0 = 5$  inside the interval  $(2, 10)$ 

$$\begin{cases} 5 - \delta = 2 \\ 5 + \delta < 10 \end{cases} \rightarrow \delta = 3 \text{ (to be centered)}$$

$$0 < |x - 5| < 3 \Rightarrow |\sqrt{x - 1} - 2| < 1$$

# How to Find Algebraically a $\delta$ for a Given $f, L, x_0$ , and $\varepsilon > 0$

The process of finding a  $\delta > 0$  such that for all x:

$$0 < |x - x_0| < \delta \implies |f(x) - L| < \varepsilon$$

Can be accomplished in two steps

- 1. Solve the inequality  $|f(x)-L| < \varepsilon$  to find an open interval (a, b) containing  $x_0$  on which the inequality holds for all  $x \neq x_0$ .
- 2. Find a value of  $\delta > 0$  that places the open interval  $\left(x_0 \delta, x_0 + \delta\right)$  centered at  $x_0$  inside the interval (a, b). The inequality  $\left|f(x) L\right| < \varepsilon$  will hold for all  $x \neq x_0$  in this  $\delta$ -interval.

60

Prove that  $\lim_{x \to 2} f(x) = 4$  if

$$f(x) = \begin{cases} x^2, & x \neq 2\\ 1, & x = 2 \end{cases}$$

#### **Solution**

We need to show that given  $\varepsilon > 0$  there exists a  $\delta > 0$  such that for all x:

$$0 < |x-2| < \delta \implies |f(x)-4| < \varepsilon$$

**1.** Solve the inequality  $|f(x)-4| < \varepsilon$  to find an open interval containing  $x_0 = 2$  on which the inequality holds for all  $x \neq x_0$ .

For  $x \neq x_0 = 2$ ,  $f(x) = x^2$ , and the inequality to solve is  $|x^2 - 4| < \varepsilon$ :

$$\begin{vmatrix} x^2 - 4 \end{vmatrix} < \varepsilon$$

$$-\varepsilon < x^2 - 4 < \varepsilon$$

$$4 - \varepsilon < x^2 < 4 + \varepsilon$$

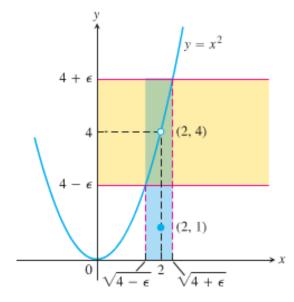

$$\sqrt{4 - \varepsilon} < |x| < \sqrt{4 + \varepsilon}$$

$$\sqrt{4 - \varepsilon} < x < \sqrt{4 + \varepsilon}$$
Add 4 to all sides

Square root

Assume  $\varepsilon < 4$ 

The inequality  $|f(x)-4| < \varepsilon$  holds for all  $x \ne 2$  in the open interval  $(\sqrt{4-\varepsilon}, \sqrt{4+\varepsilon})$ 

**2.** Find a value of  $\delta > 0$  that places the open interval  $(2 - \delta, 2 + \delta)$  inside the interval  $(\sqrt{4 - \varepsilon}, \sqrt{4 + \varepsilon})$ .

Take  $\delta$  to be the distance from  $x_0 = 2$  to the nearer endpoint of  $(\sqrt{4-\varepsilon}, \sqrt{4+\varepsilon})$ .

$$\Rightarrow \delta = \min(2 - \sqrt{4 - \varepsilon}, \sqrt{4 + \varepsilon} - 2).$$

$$0 < |x - 2| < \delta$$

$$-(2 - \sqrt{4 - \varepsilon}) < x - 2 < \sqrt{4 + \varepsilon} - 2$$

$$-2 + \sqrt{4 - \varepsilon} < x - 2 < \sqrt{4 + \varepsilon} - 2$$

$$\sqrt{4 - \varepsilon} < x < \sqrt{4 + \varepsilon}$$

$$\therefore 0 < |x - 2| < \delta \implies |f(x) - 4| < \varepsilon$$

Given that 
$$\lim_{x \to c} f(x) = L$$
 and  $\lim_{x \to c} g(x) = M$ , prove that  $\lim_{x \to c} (f(x) + g(x)) = L + M$ 

#### **Solution**

We need to show that given  $\varepsilon > 0$  there exists a  $\delta > 0$  such that for all x:

$$0 < |x - c| < \delta \implies |f(x) + g(x) - (L + M)| < \varepsilon$$

$$|f(x) + g(x) - (L + M)| = |f(x) + g(x) - L - M|$$

$$= |(f(x) - L) + (g(x) - M)| \qquad \textbf{Triangle Inequality } |a + b| \le |a| + |b|$$

$$\le |(f(x) - L)| + |(g(x) - M)|$$

Since  $\lim_{x\to c} f(x) = L$ , there exists a number  $\delta_1 > 0$  such that for all x:

$$0 < |x - c| < \delta_1 \implies |f(x) - L| < \frac{\varepsilon}{2}$$

Similarly, since  $\lim_{x\to c} g(x) = M$ , there exists a number  $\delta_2 > 0$  such that for all x:

$$0 < |x - c| < \delta_2 \implies |g(x) - M| < \frac{\varepsilon}{2}$$

Let  $\delta = \min\left\{\delta_1, \ \delta_2\right\}$ , the smaller of  $\delta_1$  and  $\delta_2$ . If  $0 < |x - c| < \delta$  then  $0 < |x - c| < \delta_1$ , so  $|f(x) - L| < \frac{\mathcal{E}}{2}$  and  $|x - c| < \delta_2$ , so  $|g(x) - M| < \frac{\mathcal{E}}{2}$ . Therefore

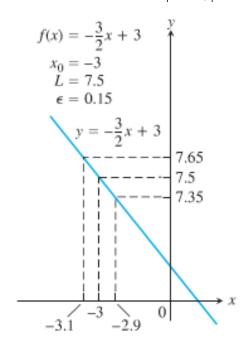

$$|f(x)+g(x)-(L+M)| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

This show that  $\lim_{x \to c} (f(x) + g(x)) = L + M$ 

# **Exercises** Section 1.6 – Precise Definition of Limits

- (1-2) Sketch the interval (a, b) on the x-axis with the point  $x_0$  inside. Then find a value of  $\delta > 0$  such that for all x,  $0 < \left| x x_0 \right| < \delta \implies a < x < b$  for
- 1. a = 1, b = 7,  $x_0 = 5$

- **2.**  $a = -\frac{7}{2}$ ,  $b = -\frac{1}{2}$ ,  $x_0 = -\frac{3}{2}$
- 3. Use the graph to find a  $\delta > 0$  such that for all  $x \mid 0 < |x x_0| < \delta \implies |f(x) L| < \varepsilon$

- (4-8) Find an open interval about  $x_0$  on which the inequality  $|f(x)-L| < \varepsilon$  holds. Then give a value for  $\delta > 0$  such that for all x satisfying  $0 < |x-x_0| < \delta$  the inequality  $|f(x)-L| < \varepsilon$  holds.
- **4.** f(x) = x + 1, L = 5,  $x_0 = 4$ ,  $\varepsilon = 0.01$
- **5.**  $f(x) = \sqrt{x+1}$ , L = 1,  $x_0 = 0$ ,  $\varepsilon = 0.1$
- **6.**  $f(x) = \sqrt{x-7}$ , L = 4,  $x_0 = 23$ ,  $\varepsilon = 1$
- 7.  $f(x) = x^2$ , L = 3,  $x_0 = \sqrt{3}$ ,  $\varepsilon = 0.1$
- **8.**  $f(x) = \frac{120}{x}$ , L = 5,  $x_0 = 24$ ,  $\varepsilon = 1$

(9-14) Give a formal proof that

9. 
$$\lim_{x \to 4} (9 - x) = 5$$

**10.** 
$$\lim_{x \to 1} \frac{1}{x} = 1$$

11. 
$$\lim_{x \to 5} \frac{x^2 - 25}{x - 5} = 10$$

**12.** 
$$\lim_{x \to 0} f(x) = 0$$
 if  $f(x) = \begin{cases} 2x, & x < 0 \\ \frac{x}{2}, & x \ge 0 \end{cases}$ 

13. 
$$\lim_{x \to 1} (5x - 2) = 3$$

14. 
$$\lim_{x \to 2} \frac{1}{(x-2)^4} = \infty$$

**15.** Prove that 
$$\lim_{x \to 0} x \sin\left(\frac{1}{x}\right) = 0$$
