Exercise

Let *R* be the region bounded by the graph of $f(x) = cx(1-x)$ and the *x-axis* on $[0, 1]$. Find the positive value of *c* such that the volume of the solid generated by revolving *R* about the *x-axis* equals the volume of the solid generated by revolving *R* about the *y-axis*.

Solution

About *x-axis* : (Using Disks)

$$V = \pi \int_0^1 c^2 x^2 (1-x)^2 \, dx$$

Solution

$$(x-3)^2 + y^2 = 4$$

$$x = 3 \pm \sqrt{4-y^2}$$

$$V = \pi \int_{-2}^{2} \left[\left(3+\sqrt{4-y^2}\right)^2 - \left(3-\sqrt{4-y^2}\right)^2 \right] dy$$

Exercise

The nose of a rocket is a solid of revolution of base radius r and height h that must join smoothly to the cylindrical body of the rocket. Taking the origin at the tip of the nose and the x-axis along the central axis of the rocket, various nose shapes can be obtained by revolving the cubic curve

$$y = f(x) = ax + bx^2 + cx^3$$

about x-axis. The cubic curve must have slope 0 at $x = h$, and its slope must be positive for $0 < x < h$. Find the particular cubic curve that maximizes the volume of the nose. Also show that his choice of the cubic makes the slope $\dfrac{dy}{dx}$ at the origin as large as possible and, hence, corresponds to the bluntest nose.

Solution

$$f'(x) = a + 2bx + 3cx^2$$

$$f'(h) = a + 2bh + 3ch^2 = 0$$

$$f(h) = ah + bh^2 + ch^3 = r$$

$$\begin{cases} a + 2bh + 3ch^2 = 0 \\ ah + bh^2 + ch^3 = r \end{cases}$$
$$\begin{cases} 2hb + 3h^2c = -a \\ h^2b + h^3c = r - ah \end{cases}$$

$$b = \frac{\begin{vmatrix} -a & 3h^2 \\ r-ah & h^3 \end{vmatrix}}{\begin{vmatrix} 2h & 3h^2 \\ h^2 & h^3 \end{vmatrix}} = \frac{2ah^3 - 3rh^2}{-h^4} = \frac{3r - 2ah}{h^2}$$

$$c = \frac{\begin{vmatrix} 2h & -a \\ h^2 & r-ah \end{vmatrix}}{\begin{vmatrix} 2h & 3h^2 \\ h^2 & h^3 \end{vmatrix}} = \frac{2rh - ah^2}{-h^4} = \frac{ah - 2r}{h^3}$$

$$f(x) = ax + \frac{3r - 2ah}{h^2}x^2 + \frac{ah - 2r}{h^3}x^3$$

$$(f(x))^2 = a^2x^2 + 2\frac{3r - 2ah}{h^2}ax^3 + 2\frac{ah - 2r}{h^3}ax^4 + \frac{(3r - 2ah)^2}{h^4}x^4$$

$$+ 2\frac{(3r - 2ah)(ah - 2r)}{h^5}x^5 + \frac{(ah - 2r)^2}{h^6}x^6$$

$$= a^2x^2 + \frac{6r - 4ah}{h^2}ax^3 + \left(\frac{2a^2h - 4ar}{h^3} + \frac{9r^2 - 12ahr + 4a^2h^2}{h^4}\right)x^4$$

$$+ \frac{14ahr - 12r^2 - 4a^2h^2}{h^5}x^5 + \frac{a^2h^2 - 4ahr + 4r^2}{h^6}x^6$$

The volume of the nose cone is then

$$V(a) = \pi \int_0^h (f(x))^2\, dx$$

$$= \pi \int_0^h \left(a^2x^2 + \frac{6r - 4ah}{h^2}ax^3 + \left(\frac{2a^2h - 4ar}{h^3} + \frac{9r^2 - 12ahr + 4a^2h^2}{h^4}\right)x^4 \right.$$

$$= \pi \left| \frac{1}{3}a^2x^3 + \frac{1}{4}\frac{6r - 4ah}{h^2}ax^4 + \frac{1}{5}\left(\frac{2a^2h - 4ar}{h^3} + \frac{9r^2 - 12ahr + 4a^2h^2}{h^4}\right)x^5 \right.$$
$$\left. + \frac{1}{6}\frac{14ahr - 12r^2 - 4a^2h^2}{h^5}x^6 + \frac{1}{7}\frac{a^2h^2 - 4ahr + 4r^2}{h^6}x^7 \right|_0^h$$

$$= \pi \left[\frac{1}{3}a^2h^3 + \frac{1}{4}\frac{6r - 4ah}{h^2}ah^4 + \frac{1}{5}\left(\frac{2a^2h - 4ar}{h^3} + \frac{9r^2 - 12ahr + 4a^2h^2}{h^4}\right)h^5 \right.$$
$$\left. + \frac{1}{6}\frac{14ahr - 12r^2 - 4a^2h^2}{h^5}h^6 + \frac{1}{7}\frac{a^2h^2 - 4ahr + 4r^2}{h^6}h^7 \right]$$

$$= \pi \left[\frac{1}{3}a^2h^3 + \frac{3}{2}ah^2r - a^2h^3 + \frac{1}{5}\left(2a^2h^3 - 4ah^2r + 9hr^2 - 12ah^2r + 4a^2h^3\right) \right.$$
$$\left. + \frac{1}{6}\left(14ah^2r - 12hr^2 - 4a^2h^3\right) + \frac{1}{7}\left(a^2h^3 - 4ah^2r + 4hr^2\right) \right]$$

$$= \pi \left[-\frac{2}{3}a^2h^3 + \frac{3}{2}ah^2r + \frac{6}{5}a^2h^3 - \frac{16}{5}ah^2r + \frac{9}{5}hr^2 \right.$$
$$\left. + \frac{7}{3}ah^2r - 2hr^2 - \frac{2}{3}a^2h^3 + \frac{1}{7}a^2h^3 - \frac{4}{7}ah^2r + \frac{4}{7}hr^2 \right]$$

$$= \pi \left(\frac{1}{105}a^2h^3 + \frac{13}{210}ah^2r + \frac{13}{35}hr^2 \right)$$

$$\underline{= \frac{\pi h}{210}\left(2a^2h^2 + 13ahr + 78r^2\right)}$$

$$\frac{dV}{da} = \frac{d}{da}\left[\frac{\pi h}{210}\left(2a^2h^2 + 13ahr + 78r^2\right) \right]$$

$$= \frac{\pi h}{210}\left(4ah^2 + 13hr\right) = 0$$

$$4ah^2 + 13hr = 0 \quad \Rightarrow \quad a = -\frac{13r}{4h} \quad (CN)$$

Which is unacceptable since $a \geq 0$, and because $f'(x) > 0$ on $(0, h)$.

$$f'(x) = \frac{3ah - 6r}{h^3}x^2 + \frac{6r - 4ah}{h^2}x + a$$

$$x = \frac{-\dfrac{6r - 4ah}{h^2} \pm \sqrt{\dfrac{36r^2 - 48ahr + 16a^2h^2}{h^4} - \dfrac{12a^2h - 24ar}{h^3}}}{\dfrac{6ah - 12r}{h^3}}$$

$$= \frac{-6r + 4ah \pm \sqrt{36r^2 - 48ahr + 16a^2h^2 - 12a^2h^2 + 24ahr}}{6ah - 12r} \cdot h$$

$$= \frac{-6r + 4ah \pm \sqrt{36r^2 - 24ahr + 4a^2h^2}}{6ah - 12r} \cdot h$$

$$= \frac{-6r + 4ah \pm \sqrt{(6r - 2ah)^2}}{6ah - 12r} \cdot h$$

$$= \frac{-6r + 4ah \pm (6r - 2ah)}{6ah - 12r} \cdot h$$

$$\begin{cases} x_1 = \dfrac{-6r + 4ah - 6r + 2ah}{6ah - 12r} \cdot h = \dfrac{6ah - 12r}{6ah - 12r} \cdot h = h \Big| \\[4mm] x_2 = \dfrac{-6r + 4ah + 6r - 2ah}{6ah - 12r} \cdot h = \dfrac{2ah^2}{6ah - 12r} = \dfrac{ah^2}{3ah - 6r} \Big| \end{cases}$$

If $0 < x_2 < h \quad \Rightarrow \quad 0 < \dfrac{ah^2}{3ah - 6r} < h \quad \rightarrow \quad 0 < ah^2 < 3ah^2 - 6rh$

$$0 < a < 3a - 6\frac{r}{h} \qquad \Rightarrow \quad a > 0$$

$$-2a < -6\frac{r}{h} \quad \Rightarrow \quad a > \frac{3r}{h}$$

Hence, $0 \leq a \leq \dfrac{3r}{h}$.

We have

$$V(0) = \frac{\pi h}{210}\left(78r^2\right)$$

$$= \frac{13}{35}\pi r^2 h \quad unit^3 \Big|$$

$$V\left(\frac{3r}{h}\right) = \frac{\pi h}{210}\left(2\frac{9r^2}{h^2}h^2 + 13\frac{3r}{h}hr + 78r^2\right)$$

$$= \frac{\pi h}{210}\left(18r^2 + 39r^2 + 78r^2\right)$$

$$= \frac{\pi h}{210}\left(135r^2\right)$$

173

$$= \frac{9}{14}\pi r^2 h \quad unit^3$$

The largest volume corresponds to $a = \frac{3r}{h}$, which is the largest allows value for a and so corresponds to the bluntest possible nose. The corresponding cubic $f(x)$ is

$$f(x) = ax + \frac{3r - 2ah}{h^2}x^2 + \frac{ah - 2r}{h^3}x^3$$

$$= \frac{3r}{h}x - 3\frac{r}{h^2}x^2 + \frac{r}{h^3}x^3$$

$$= \frac{r}{h^3}\left(3h^2x - 3hx^2 + x^3\right)$$

Exercise

A landscaper wants to create on level ground a ring-shaped pool having an outside radius of 10 m and a maximum depth of 1 m surrounding a hill that will be built up using all the earth excavated from the pool. She decided to use a fourth-degree polynomial to determine the cross-sectional shape of the hill and pool bottom: at distance **r** m from the center of the development the height above or below normal ground level will be

$$h(r) = a\left(r^2 - 100\right)\left(r^2 - k^2\right) \quad m$$

For some $a > 0$, where k is the inner radius of the pool.
Find k and a so that the requirements given above are all satisfied.
How much earth must be moved from the pool to build the hill?

Solution

$$h'(r) = a(2r)\left(r^2 - k^2\right) + a\left(r^2 - 100\right)(2r)$$

$$= 2ar\left(r^2 - k^2 + r^2 - 100\right) = 0$$

$$2r^2 - k^2 - 100 = 0$$

$$2r^2 = k^2 + 100$$

$$r^2 = \frac{1}{2}k^2 + 50$$

Since the depth must be 1 m, then

$$h(r) = a\left(r^2 - 100\right)\left(r^2 - k^2\right)$$

$$-1 = a\left(\frac{1}{2}k^2 + 50 - 100\right)\left(\frac{1}{2}k^2 + 50 - k^2\right)$$

$$-1 = a\left(\frac{1}{2}k^2 - 50\right)\left(-\frac{1}{2}k^2 + 50\right)$$

$$-1 = -a\left(50 + \frac{1}{2}k^2\right)\left(50 + \frac{1}{2}k^2\right)$$

$$1 = a\left(50 - \tfrac{1}{2}k^2\right)^2$$

$$a\left(100 - k^2\right)^2 = 4$$

Volume of the pool:

$$V_P = 2\pi a \int_k^{10} r\left(100 - r^2\right)\left(r^2 - k^2\right) dr$$

$$= 2\pi a \int_k^{10} -\left(r^5 - k^2 r^3 - 100 r^3 + 100 k^2 r\right) dr$$

$$= 2\pi a \left. \left(-\tfrac{1}{6}r^6 + \tfrac{1}{4}k^2 r^4 + 25 r^4 - 50 k^2 r^2\right) \right|_k^{10}$$

$$= 2\pi a \left(-\tfrac{1}{6}10^6 + \tfrac{1}{4}k^2 10^4 + 25 \times 10^4 - 50 k^2 10^2 + \tfrac{1}{6}k^6 - \tfrac{1}{4}k^6 - 25 k^4 + 50 k^4\right)$$

$$= 2\pi a \left(\tfrac{250{,}000}{3} - 2500 k^2 - \tfrac{1}{12}k^6 + 25 k^4\right) \quad unit^3$$

Volume of the hill:

$$= 2\pi a \left. \left(\tfrac{1}{6}r^6 - \tfrac{1}{4}k^2 r^4 - 25 r^4 + 50 k^2 r^2\right) \right|_0^k$$

$$= 2\pi a \left(\tfrac{1}{6}k^6 - \tfrac{1}{4}k^6 - 25 k^4 + 50 k^4\right)$$

$$= 2\pi a \left(25 k^4 - \tfrac{1}{12}k^6\right) \quad unit^3$$

Volume of the pool = Volume of the hill

$$2\pi a \left(\tfrac{250{,}000}{3} - 2500 k^2 - \tfrac{1}{12}k^6 + 25 k^4\right) = 2\pi a \left(25 k^4 - \tfrac{1}{12}k^6\right)$$

$$\tfrac{250{,}000}{3} - 2500 k^2 - \tfrac{1}{12}k^6 + 25 k^4 = 25 k^4 - \tfrac{1}{12}k^6$$

$$\tfrac{250{,}000}{3} - 2500 k^2 = 0$$

$$2500 k^2 = \tfrac{250{,}000}{3}$$

$$k^2 = \tfrac{100}{3}$$

$$k = \tfrac{10}{\sqrt{3}} \qquad \approx 5.77$$
